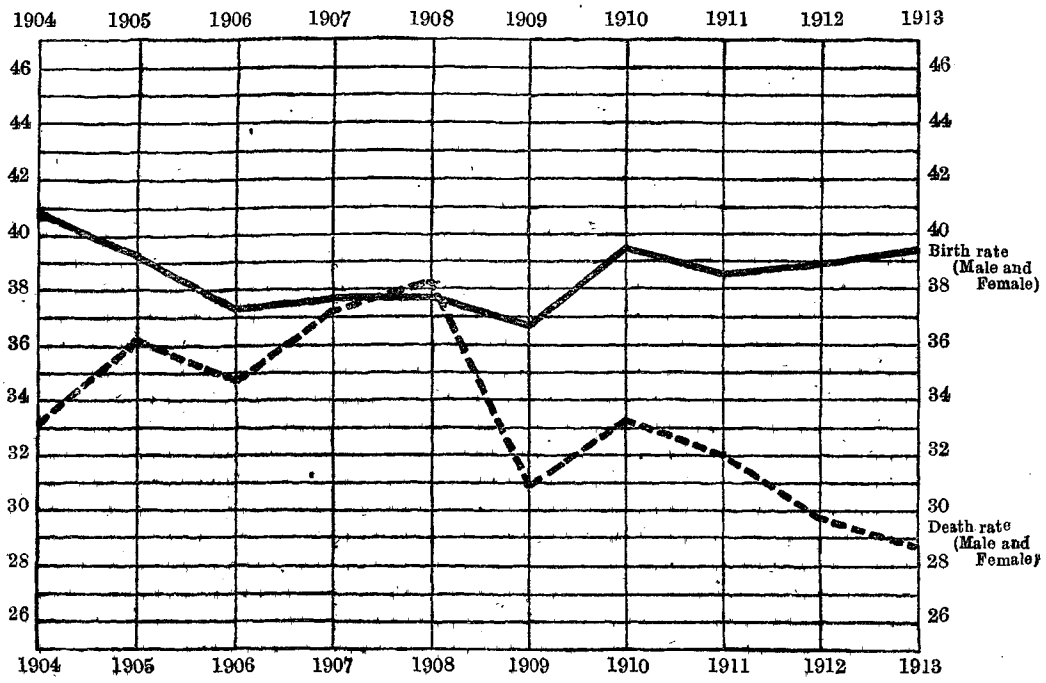
BIRTHS AND DEATHS

Birth rate and Death rate per 1,000 of population in British India

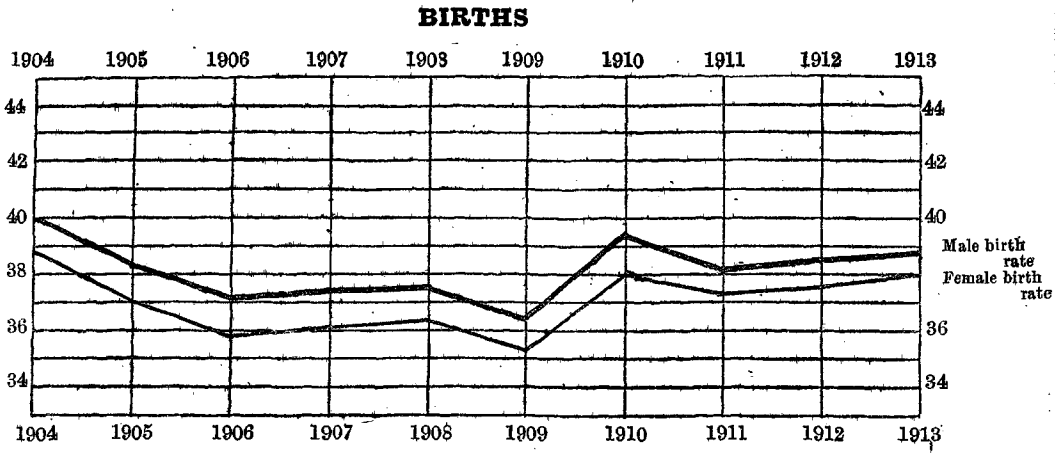
I

BIRTHS AND DEATHS



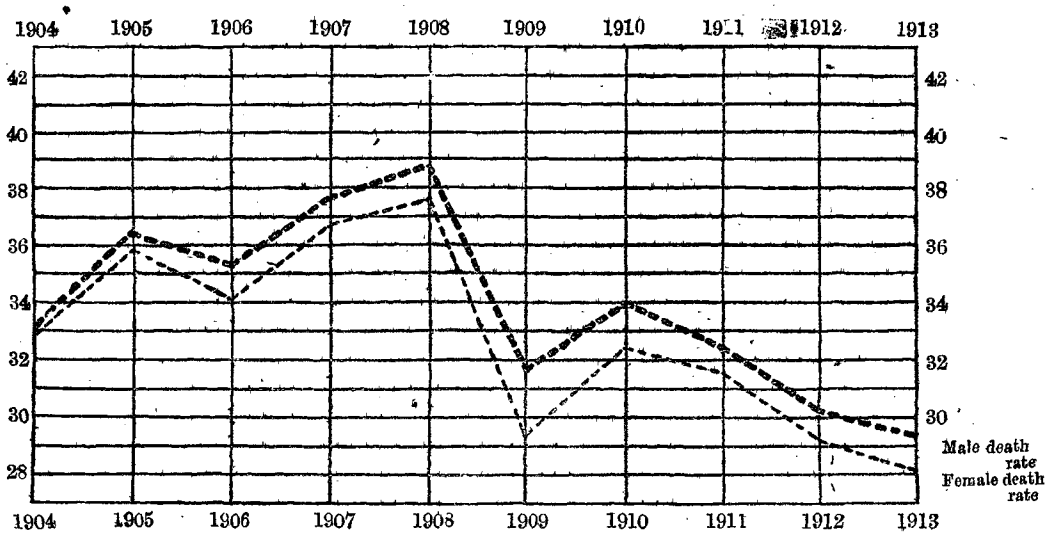
II

BIRTHS



III

DEATHS



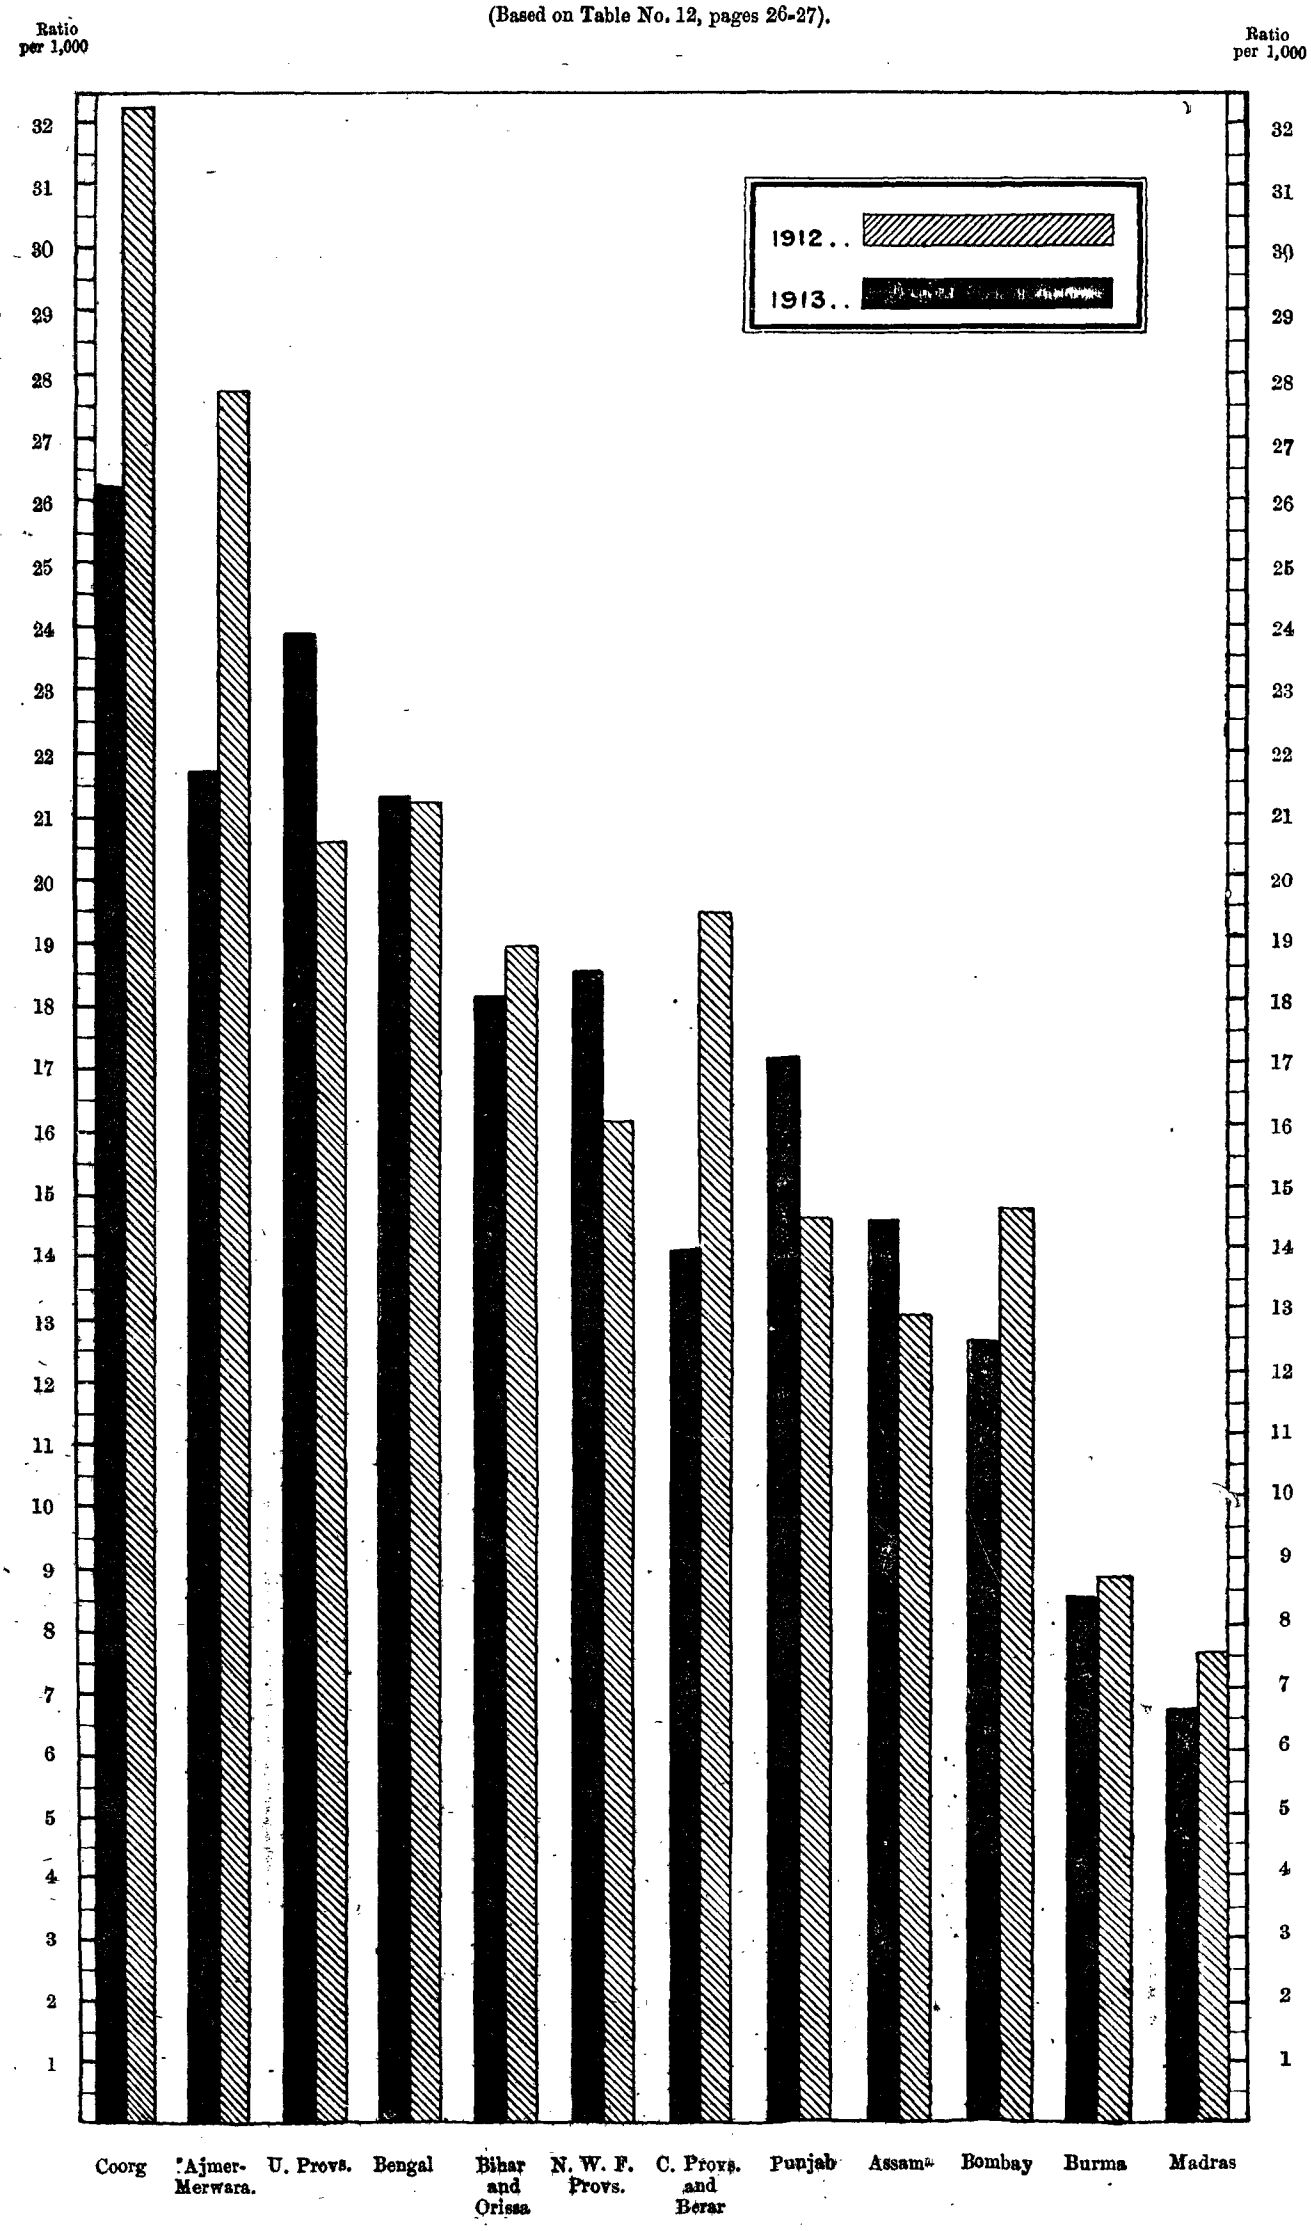
NOTE—The curves are based on the statistics in tables 2, 3 and 4.

The deaths in 1908 were high 8,653,007, as compared with the average of the previous five years 7,900,632, an increase of 9·5 per cent. The greater percentage of these deaths in 1908 was due to (1) fevers 62·7 per cent., (2) cholera 6·8 per cent., (3) small pox 2 per cent. The provinces that suffered most were the United Provinces and Madras.

MORTALITY RATES FROM "FEVERS."

Ratio of Deaths from "Fevers" per 1,000 of population in each province of British India in 1913, as compared with the previous year.

(Based on Table No. 12, pages 26-27).

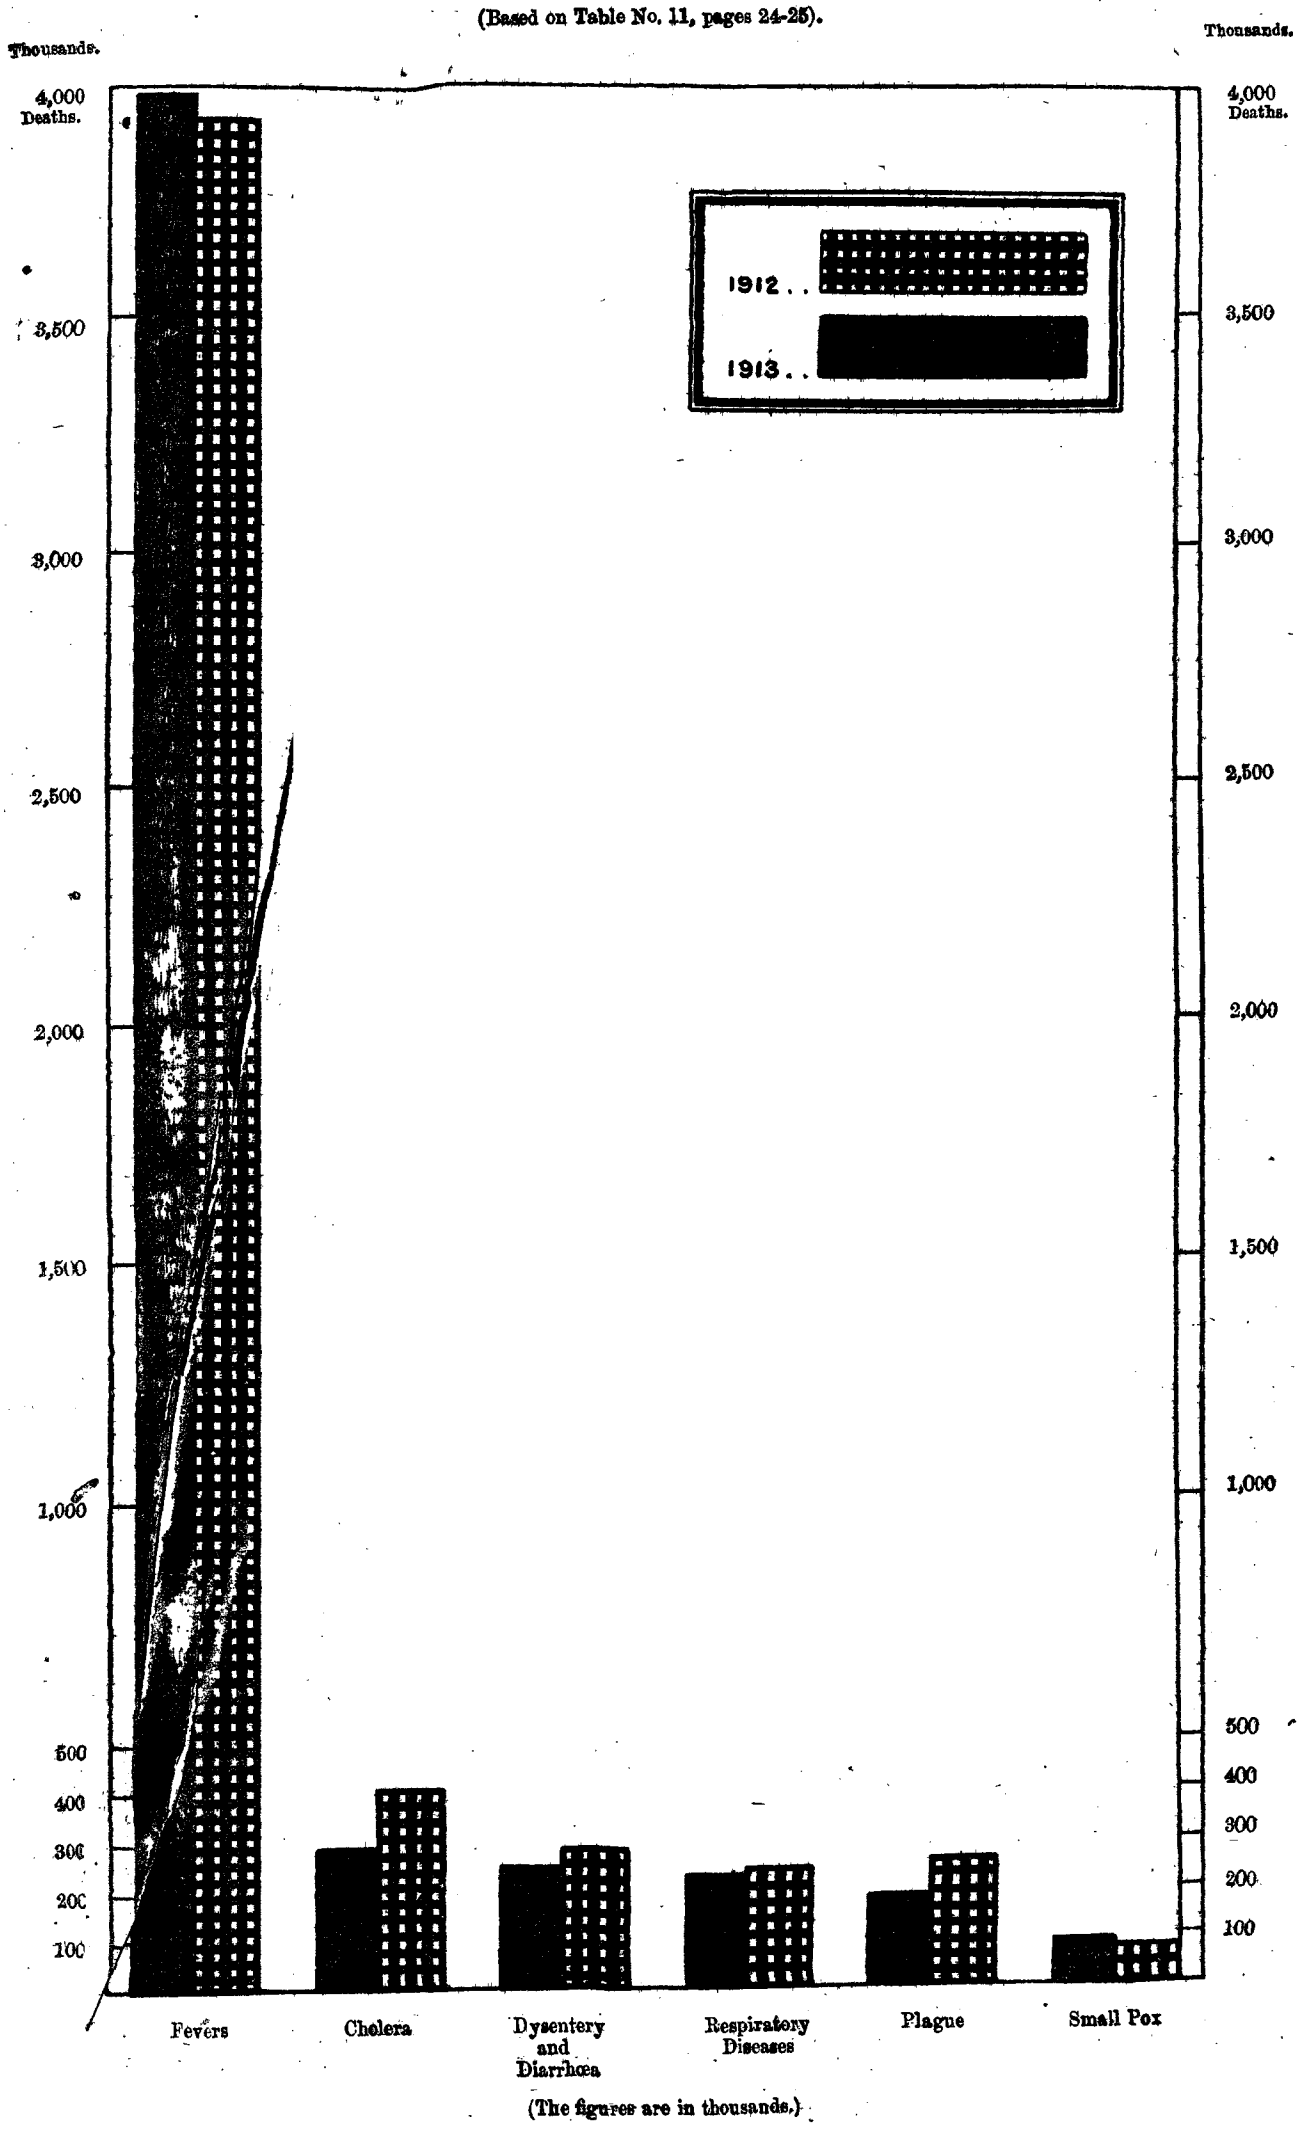


The figures for the Province of Delhi during 1912 were not available as they were included in the Punjab. In Delhi the Death rate from fevers during 1913 was 26·18 per 1,000 of population.

MORTALITY FROM PRINCIPAL DISEASES.

Deaths from Principal Diseases in British India during 1913, as compared with the previous year.

(Based on Table No. 11, pages 24-25).



(The figures are in thousands.)

SEVENTH ABSTRACT OF PUBLIC HEALTH STATISTICS.

INTRODUCTORY NOTE.

The Statistics included in the volume were formerly published in Part V of the Statistics of British India as will be seen from the foot-note below. They relate chiefly to vital occurrences, hospitals, lunatic asylums, vaccination, etc. This volume, on account of the changes that have been made, is in many respects the first of a new series. The statistics refer, with the exception of those relating to vaccination, to the calendar, and not to the financial year. The tables have in one or two instances been reconstructed, but the continuity of record has been preserved almost entirely. An Index has been added for easy reference, as also charts, showing the Indian birth and death rates for a series of years, mortality from "Fevers" in each Province and from Principal Diseases in British India. Owing to the War, to the increased work connected with the changes in this volume, and to the late receipt in some cases of reports from local authorities, it was not possible to publish the volume as early as was anticipated. An attempt has been made in this note to bring out the main conclusions that may be drawn from the summary and general tables.

SUMMARY TABLE.

The table on pages 1 and 2 gives the salient features of the statistics relating to Public Health.

VITAL STATISTICS.

Birth and Death Rates.

In India there is no universal *compulsory* registration of births and deaths, as in the United Kingdom and in certain other countries. The registration of births and deaths is now carried out in a population of 238 millions, or some 98 per cent, of the total population of British India. The reporting of vital occurrences is still defective, and all conclusions from these statistics should be drawn under reserve. Nevertheless these records of vital occurrences are valuable for comparative purposes, especially when one year is compared with its immediate predecessor, and one month of the year with another. These returns also enable one to distinguish generally the comparative birth rates and death rates, province by province, and the general causes of mortality, healthy and unhealthy seasons of the year, and also years of especially low or high mortality. A comprehensive scheme for the general recording of vital statistics has been formulated by the Government of India in a Resolution on Indian Sanitary Policy which is published as an appendix to this volume.* Owing to the War the enquiry referred to in the Resolution has been for the present deferred. This enquiry was to have been conducted under the auspices of the Indian Research Fund. It is sometimes said that a higher level of intelligence and education together with the fear of legal penalties tend to make the registration of births and deaths in towns more accurate than in rural tracts; a study of the Annual Sanitary Reports for the various provinces, however, does not entirely support this view. Instances are recorded of municipalities in whch the percentage of unreported births and deaths has ranged according to one expert, as high as from 35 to 75 per cent. Wherever independent investigation has been undertaken a large proportion of omissions has been discovered. In rural areas it is generally recognized that registration is very often incomplete and unsatisfactory. Dr. Bentley, Officiating Sanitary Commissioner, Bengal, observed in a paper on Vital Statistics (submitted to the All-India Sanitary Conference in 1914) that in rural areas in Bengal where the recording of vital occurrences is one of the duties of the village chowkidars or watchmen, the error in registration appeared to be largely due to unequal distribution of the chowkidars in different districts, and that districts which possessed a high proportion of chowkidars invariably showed a relatively high mortality, and districts with a low proportion of chowkidars recorded a low mortality. This may, indeed, apply to other provinces besides the Presidency of Bengal. It shows that the registration of births and deaths is defective, and a caveat to this effect is necessary in any complete examination of returns. The Actuary in the Census of 1911 points out:—

> "The registers of births and deaths, although showing great and progressive improvement as compared with previous years are still very incomplete and probably contain many inaccuracies."

The Census report also states that "In most provinces the Vital Statistics are still very defective. They are based on returns from village headmen or watchmen; and although they are tested to a certain extent, this checking is not complete and thorough."

The Seventh Statistical Abstract was previously published as the Statistics of British India now divided into five volumes as follows:—

STATISTICAL ABSTRACT. (Seventh Issue.)	STATISTICS OF BRITISH INDIA.
Vol. I.—Commercial Statistics (published).	(I) Industrial.
Vol. II.—Financial Statistics (in press).	(II) Commercial.
Vol. III.—Public Health Statistics (published).	(III) Commercial Services.
Vol. IV.—Administrative, Judicial and Local Self Government Statistics includes area, population and Local Funds (under preparation).	(IV) (*a*) and (*b*) Finance and Revenue. (V) Area, Population and Public Health. (VI) Administrative and Judicial.
Vol. V.—Education Statistics (published).	(VII) Educational. (VIII) Local Funds.

* *Vide* pages 114—126.

It appears from an investigation made in India of the variation of the population during the ten years 1901-1910, by comparison of the relative numbers of registered births and deaths with the movement in population as shown by the Censuses of 1901 and 1911, that the movement, as shown by these two methods varies quite materially in each Province. For instance, in the Province of Bombay, the statistics of births and deaths show a reduction in the total population of 217,469 while the Census Returns for the same province show an increase of 1,110,801 persons, the difference between these figures being 1,328,270. The inflow of immigrants, it may be noted, during the decennium in the Province of Bombay will only account for a small portion of this difference. Again, if the United Provinces of Agra and Oudh, the excess of births over deaths during the decennium amounts to 1,017,726, whilst the population statistics show a diminution in the population of 510,233, a difference of 1,527,959 and here again, the outflow of emigrants during the decennium will not account for this large discrepancy.

The Indian Birth Rate.

The total number of births in British India rose from 9,295,296 in 1912 to 9,383,218 in 1913. This represents a birth rate of 39·37 per thousand. The Central Provinces record the highest birth rate, 49·26 per mille, followed by the United Provinces 47·67, the Punjab 45·4 and Bihar and Orissa 42·10. All the other major provinces had a birth rate below 40 but over 30 per mille. Burma with a birth rate of 32·61 per mille and Madras 32·2 per mille record the lowest rates. The following is the birth rate per Province.

Ratio of Births in each 1,000 of population by Provinces.

Central Provinces and Berar	49·26
United Provinces	47·67
Punjab	45·4
Bihar and Orissa	42·10
Delhi	44·84
Ajmer-Merwara	43·19
North-West Frontier Province	36·2
Bombay	34·96
Bengal	33·75
Assam	33·06
Burma	32·61
Madras	32·2
Coorg	25·88

This birth rate is considerably higher than in most European countries. According to the report of the Registrar General of Births, Deaths and Marriages in England and Wales (1913), the total births in proportion to the total population of both sexes and all ages, were equal to a rate of 23·9 per 1,000 living. In the year 1876 it may be noted that the birth rate in England and Wales attained the highest point on record, *viz.*, 36·3 per thousand, since which date the ratio has with a few insignificant exceptions, fallen year by year. The birth rate in Scotland according to the Registrar General for Scotland (1912) was 25·90 per thousand of the estimated population. It will be seen that these birth rates are very considerably lower than the Indian birth rates.

No decline in the Indian Birth rate.

It is interesting to note that the Indian birth rate does not share in the general decline which is noticeable in most European countries. The birth rate in India has risen from 35·6 per 1,000 of population in the quinquennial period 1886-90 to 39·4 in 1913. From the latest available international birth rate statistics it appears that the German Empire, which recorded a birth rate of 36·5 per 1,000 persons living in the quinquennial period 1886-90 had a birth rate of 28·3 in 1912. The rate in France has declined from 23·1 in the same quinquennial period to 19 in 1913. In Italy it has declined from 37·5 in 1886-90 to 32·4 in 1912. In Denmark from 31·4, in Norway from 30·8, in Sweden from 28·8 in 1886-90 to 25·6, 25·2 and 23·1 in 1913 respectively. While Roumania records a rise from 40·9 in the same quinquennial period to 42·1 in 1913. In connection with the steady increase in the Indian birth rate allowance should be made for the incompleteness of the earlier records. It would perhaps not be wrong to anticipate higher birth rates and also even higher death rates with the increased attention that is now paid to registration.

It will be seen from Table No. 3 that there is very great variation between the maximum and minimum for districts, in Bengal, for example, the maximum in any district in 1913 was 41·64 per thousand of population, the minimum was 20·51. For Madras it was 38·7 and 25·4 respectively, for Bombay 49·81 and 17·38 respectively; for the United Provinces 58·21 and 28·19 respectively; for Bihar and Orissa 48·16 and 34·65 respectively: for the Punjab 53·5 and 21·9 respectively; for Delhi 47·12 and 19·33 respectively; for Burma 41·17 and 18·87 respectively; for Central Provinces and Berar 55·31 and 43·23 respectively; for Assam 40·17 and 29·23 respectively; for North-West Frontier Province 39·8 and 33·8 respectively.

Excess of Male Births.

A characteristic of the Indian birth rate and population is the higher birth rate of males and the excess of males over females in the total population. The mean percentage of male to female births ranged from 126·5 in the North-West Frontier Province to 104 in Bihar and Orissa and 100·84 in Coorg. Generally speaking, it will be seen that the proportion of female births is lowest in the North-West of India, and that it greatly increases

towards the South-East, being highest in Madras, the Central Provinces and Berar, Bihar and Orissa, and Burma. It is also interesting to contrast the proportion for the whole of India with that obtained in Western Europe where the number of females per thousand males varies from 1,093 in Portugal and 1,068 in England and Wales to 1,013 in Belgium and 1,003 in Ireland, the general average being 1,038. The figure (1,038) is taken from J. Athelstane Baines's paper on the Recent Growth of Population in Western Europe. (Journal of the Royal Statistical Society, LXXII, 685). At the same time it should be noted that with regard to the proportions in India and Western Europe that Western Europe is the only part of the world where females are in excess. In the South-East of Europe they are in marked defect; and in some of the Balkan States the deficiency is almost as great as it is in India. The same state of things exists in all eastern countries where censuses have been taken, as well as in the United States, Canada, New Zealand and several of the Australian Colonies. It may be said that in respect of the sex proportions the figures for Western Europe may be taken as exceptional, and that those in India do not differ greatly from the proportions in other parts of the world. In the table below the following countries of the British Empire are arranged in the serial order of the proportion of females to males among their inhabitants* :—

Country.	Females to 1,000 males.	Country.	Females to 1,000 males.
North Nigeria	1,698	Gambia Protectorate	980
Barbados	1,449	South Africa (Black)	970
Leeward Isles	1,307	Cyprus	967
Nyassaland	1,259	India	953
Bahamas	1,244	Newfoundland	952
Swasiland	1,231	British Guiana	926
Windward Isles	1,213	Australia	926
Uganda	1,211	Trinidad	912
Basutoland	1,197	Mauritius	903
Gibraltar (Civil)	1,176	South Rhodesia	899
South Nigeria	1,166	New Zealand	896
Channel Isles	1,128	Ceylon	888
Bermudas	1,094	Wei-hai-wei	887
Jamaica	1,092	Canada	886
England and Wales	1,068	South Africa (whites)	863
Scotland	1,062	Sierra Leone (colony)	840
Ireland	1,003	North Borneo	812
Malta (Civil)	1,003	Fiji	744
Bechuana Protectorate	999	Hong-kong	542
Siam States	997	Straits-Settlements	528
Gold Coast Protectorate	988	Malay States	429
British Honduras	986	Falkland Isles	382

With regard to the provinces in India the table below exhibits the order of proportion of males to every 100 females amongst their inhabitants in 1913 and this is of exceptional interest in regard to the study of birth rates and the relations of the relative proportion of the sexes :—

Bengal	106
Madras	104·5
Bombay	108·15
United Provinces	108·16
Bihar and Orissa	104
Punjab	109·7
Delhi	106·48
Burma	106
Central Provinces and Berar	104·79
Assam	107
North-West Frontier Province	126·5
Ajmer-Merwara	110·50
Coorg	100·84

It may be noted that there is sometimes a considerable difference between the reported occurrences of births and those calculated by the Actuary at the 1911 Census. It will be seen from the marginal statement that while in the Punjab, the estimated and reported birth rates closely agree, the difference in other provinces is large. The vital statistics, as already pointed out, are based on returns from village headmen or chowkidars, and although they are tested to a certain extent this checking is in no way so complete and thorough as is the checking of the census schedules by supervisors and charge superintendents.

Province.	Rate per mille of births. Reported.	Estimated by Actuary
Assam and Bengal	38·9	46·7
Bombay	33·4	41·0
Burma	33·9	42·9
Madras	30·8	41·9
Punjab	41·2	44·3
United Provinces	41·4	46·5

The Indian Death Rate.

The total number of deaths in British India fell from 7,090,991 in 1912 to 6,845,018 in 1913 or from 29·71 to 28·72 per thousand of population, which was the lowest on record since 1898. The continued fall of the death rate from 33·2 in 1910 to 28·72 in 1913 is interesting. The death rate in seven of the major provinces of British India was lower than in 1912. The United Provinces, the Punjab, Assam, and the North-West Frontier Province reported enhanced rates as compared with the preceding year. In the two latter provinces the increase was not very considerable; the United Provinces, however, reported a death rate of 34·84 per mille, as compared with 29·91 in 1912; the Punjab rate also increased from 26·88 to 30·19. Plague and fever

Cf. Sir J. A. Baines's paper on the Census of the Empire, 1911. (Journal of the Royal Statistical Society, Vol. LXXVII, March 1914, page 391.)

are largely responsible for the high rate in the United Provinces. As regards the Punjab it should be noted that the death rate in 1912 was the lowest recorded since 1886, and although the figure for 1913 is high as compared with that of the previous year, it is still well below the quinquennial average of 35·4. The most noteworthy fall in the death rate occurred in the Central Provinces where the rate was 30·28 per mille as against 42·34 in 1912 due to an exceptionally healthy year. The fall in the Bombay Presidency death rate from 34·88 in 1912 to 26·63 per mille in 1913 is noticeable. The fall in the death rate in Madras Presidency from 24·3 in 1912 to 21·4 in 1913, which is the lowest rate, gives proof of a remarkably healthy year. The North-West Frontier Province which in 1912 had the lowest death rate 23·39 per mille, occupied the second place in 1913 with a rate of 24·65, Burma being third with 24·99.

In table 4 the number, and ratio to population, of deaths is shown for a period of ten years. The variation between the maximum and minimum for any one district is of exceptional interest. In 1913 the variation in Bengal was 40·44 and 20·44 ; Madras 40·3 and 16·9 ; Bombay 36·97 and 13·27 ; United Provinces 49·24 and 23·25 ; Bihar and Orissa 34·97 and 19·94 ; Punjab 44·8 and 18·3 ; Delhi 43·74 and 20·14 ; Burma 39·45 and 18·66 ; Central Provinces and Berar 40·57 and 24·30 ; Assam 33·80 and 20·90 ; North-West Frontier Province 28·2 and 21·5.

During the year 1913 the death rate, province by province, was as follows :—

Province.	Ratio per 1,000 of population.
Delhi	39·99
United Provinces	34·84
Coorg	33·48
Central Provinces and Berar	30·28
Punjab	30·2
Bengal	29·38
Bihar and Orissa	29·14
Assam	27·66
Bombay	26·63
Ajmer-Merwara	25·85
Burma	24·99
North-West Frontier Province	24·7
Madras	21·4

It is interesting to compare the Indian death rate with the death rate in England and Wales. According to the Registrar General in his report for 1913, the death rate corresponds to the rate of 13·7 per thousand of population which is lower than any recorded previous to 1910 except 1912. The death rate of Scotland according to the Registrar General was 15·26 in 1912 ; it may be noted that the Scottish rate from 1858 to 1880 was more than 20 per thousand ; in 1881 it fell for the first time below 20 ; in 1886 for the first time below 19; in 1894 for the first time below 18 ; in 1896 for the first time below 17 ; in 1909 for the first time below 16.

In 1912 the death rate of Ireland was 16·5 and in other European countries the rates in the same year were as follows :—

Hungary, 23·3 ; Roumania, 22·9 ; Spain, 21·8 ; Servia, 21·1 ; Austria, 20·5 ; Italy, 18·2 ; France, 17·5 ; Finland, 16·3 ; Prussia, 15·5 ; Sweden, 14·2 ; Norway, 13·5 ; Denmark, 13·0 and Holland, 12·3.

The chart in the *frontispiece* illustrates the fact that the male death rate is higher than the female death rate.

Infantile Mortality.

An analysis of tables 7 and 8 will show the remarkable mortality of children under one year ; the figures are as follows :—

Ratio of deaths in each thousand of population *under one year* of age.

Province.	1912.		1913.		1912.	1913.
	Male.	Female.	Male.	Female.	Both sexes.	
Bengal	220·63	203·45	217·41	201·24	212·32	209·59
Madras	199·78	180·5	189·31	170·30	190·39	180·01
Bombay	225·81	211·01	194·03	182·34	218·70	188·42
United Provinces of Agra and Oudh	213·73	198·74	237·21	221·58	206·54	229·70
Bihar and Orissa	188·34	170·94	178·64	164·53	179·85	171·75
Burma	245·96	209·13	238·43	203·29	228·15	221·40
Central Provinces and Berar	312·23	274·13	246·04	214·94	293·60	230·86
Assam	205·61	187·11	210·60	191·17	196·68	201·21
Average	218·50	199·26	212·86	194·88	209·18	204·15

Infantile mortality rates vary considerably, province by province, and the average number of deaths below one year is 218·50 for males and 199·26 for females in 1912 and 212·86 for males and 194·88 for females in 1913. During the year 1913 among the major provinces infantile mortality was highest in the Central Provinces, the United Provinces and Burma, but it showed a decrease in Bengal, Madras, Bombay, Bihar and Orissa, Burma and the Central Provinces, as compared with the previous year. This high infantile death rate is due, according to the reports of local authorities, to the weakness of the children of immature or ignorant parents, faulty midwifery, and to the prevalence of malaria. To some extent, however, the rate is apparent since it is calculated on

imperfect returns of births. This infantile mortality rate is extremely high compared with the rates in the United Kingdom; the following is the rate as given in the Registrar General's Report for England and Wales, 1913.

Infant Mortality (Deaths under one year per 1,000 births), 1913 :—

	Males.	Females.	Both sexes.
London	115	96	106
County Boroughs	137	111	124
Other Urban districts	118	93	105
Rural Districts	99	77	88
All areas	120	96	108

The infantile mortality rate in Scotland as given in the Registrar General's report for Scotland, 1912 is 105·5 per thousand births which was the lowest infantile mortality rate recorded, the previous lowest rate was 107·7 in 1909.

Excess of births over deaths.

In the whole of British India the birth rate exceeded the death rate by 10·65 per mille, the highest figure in the last decade. During the year 1913 the birth rate exceeded the death rate in every province except Coorg the increase was most marked in the Central Provinces (where the birth rate exceeded the death rate by 18·98 per mille) the excess of births over deaths was least marked in Bengal where the difference was only 4·37 per mille.

There was, however, an excess of deaths over births in the cities of Calcutta, Bombay, Madras and Rangoon, the figures being as follows :—

	1913		
	Births.	Deaths.	Excess of deaths over births.
Calcutta	18,386	26,188	7,802
Bombay	19,327	31,505	12,178
Madras	18,954	20,322	1,368
Rangoon	5,534	8,907	3,373

The total number of births registered in Calcutta fell from 19,426 in 1912 to 18,386 in 1913, representing a birth rate of 21·6 and 20·5 per thousand of population, respectively. On the other hand, the number of deaths rose from 25,209 in 1912 to 26,188 in 1913 with a death rate of 28·1 and 29·2 per thousand, respectively. The principal causes of the increased mortality were dysentery and diarrhœa which account for over 40 per cent. Of the total increase in the number of deaths in the city, and the remainder of the increased mortality was due to respiratory diseases, tuberculosis and measles, which together account for 55 per cent. of the total increase. The death rate in Calcutta in 1913 amongst females was 39·4 per thousand as compared with 24·3 amongst males, which is the inversion of the normal ratio between male and female deaths in India generally. This high mortality amongst females is attributed largely to the purdah system. It may also be due to the extraordinary fluctuations which take place in the male population which is, as compared with the female population, not nearly so fixed.

Causes of Death.

There are three main classes of fatal disease : specific fevers, diseases affecting the abdominal organs, and the lungs. The specification of the causes of mortality is limited to cholera, small-pox, plague, fevers, dysentery and diarrhœa, respiratory diseases, and injuries. Among the principal causes of deaths, "fevers" always exact the heaviest toll. The heading "fevers" is frequently misleading. Although "fevers" in India are generally understood to mean malarial fever, many causes of death and many diseases much more fatal than malarial are included under the heading. In rural districts every known febrile condition and many non-febrile causes of death are put under this head. One authority has, for example, stated that in parts of Bengal 10 per cent. of the so-called "fever" deaths are due to tuberculosis, and malaria usually accounts for 25 to 33 per cent. of deaths so returned. In 1913 there were 3,983,112 deaths, being 58 per cent. of the total mortality.

The recorded mortality from cholera, small-pox, and plague during the last five years is shown in the margin. In this period 1,726,271 persons are reported to have died of cholera, the annual average mortality being 345,254. The deaths from small-pox were nearly one-fourth of the deaths from cholera, amounting in the same period to 398,514, the annual average being 79,703. Deaths from plague amounted to 1,753,763, the annual average being 350,753. It is satisfactory to note that there was a marked decrease in the number of deaths from cholera during the year 1913. The mortality from small-pox increased from 89,357 in 1912 to 98,155 in 1913, the larger increase being in the provinces of Bombay, United Provinces and the Punjab. The Punjab recorded 38,687 deaths in 1913, the highest figure in the decennium.

	Cholera.	Smallpox.	Plague.
1909	239,231	101,152	145,333
1910	430,451	51,315	413,355
1911	354,005	58,535	733,582
1912	407,769	89,357	263,037
1913	294,815	98,155	198,456

The number of deaths from Plague which reached the highest point in 1907 since the first outbreak in 1896 fell from 1,166,223 to 113,888 in 1908, but it increased to 733,582 in 1911, falling again to 198,456 in 1913 or

nearly 3 per cent. of the total mortality in that year. In the eighteen years during which plague has prevailed in India the total recorded deaths have been about seven millions. Bombay which has lost between 1896 and 1913 1,532,024, suffered most in the year 1903 and there has been a considerable diminution of the disease since that date; there was however a recrudescence in 1911, the mortality being one of 100,399; the number again fell to 25,288 in 1913. The year 1907 was a disastrous one for the Punjab, the number of deaths recorded during that year having aggregated 608,685 against 91,712 in 1906. After a period of two years during which the incidence of plague was comparatively light, the province was again visited with an epidemic of considerable severity in 1910 and there was an equally severe visitation in 1911, the mortality in these two years being 135,483 and 175,345, respectively. During the year 1913 the number of deaths fell to 17,877. The United Provinces which suffered almost as severely as the Punjab from the same disease in 1907 had a better year in 1908; the mortality then rose steadily to 332,301 in 1911, but in 1913, 107,683 deaths were returned. In Madras plague was responsible for 2,872 deaths in 1907 against 898 in the preceding year; in 1911 the number rose to 15,185, falling again to 5,130 in 1913. The mortality in Burma showed a slight increase from 6,946 in 1909 to 7,741 in 1910 which was ascribed to more accurate reporting of deaths. A decrease was noticeable in 1911, and this has been maintained during the year 1913 though the number is little higher than that of 1912. It is stated that this decrease in plague mortality was recorded in districts and towns where an active and up-to-date anti-plague policy had been in force for some years. The number of deaths from plague is declining as will be seen in the marginal table.

Year	Number of deaths from Plague.
1904.	938,010
1905.	940,174
1906.	300,355
1907.	1,166,223
1908.	413,888
1909.	145,333
1910.	413,355
1911.	733,582
1912.	263,037
1913.	198,456

In the face of great practical obstacles, three principal measures for combating plague are now adopted:—

(1) The temporary evacuation of quarters in which plague is prevalent. This has proved to be the most effective way of removing man from contact with infected rat-fleas. Government is ready to supply money and material to provide temporary dwellings and to alleviate the discomfort and distress which must accompany evacuation of quarters, a matter of course, in which no pressure can be exerted, and in regard to which the wishes and even the prejudices of the people must be consulted.

(2) Inoculation with the prophylactic fluid. The efficacy of this remedy on the occasion of an outbreak has been placed beyond doubt; it is freely resorted to, and encounters little popular prejudice, when the presence of plague is felt; but as a general or permanent remedy it is obviously of limited utility.

(3) The systematic destruction of rats (for which purpose smoking has been found an admirable method, as it kills the fleas as well as the rat), the diminution of the food supply to which they have access, and, in the course of time, such improvement in the structure of houses and grain-stores as shall render them reasonably rat-proof.

Deaths according to classes of population.

With regard to mortality among the different classes of the population in British India it may be noted that the ratios of deaths per thousand of population showed some improvement in the year 1913 under the classes Hindus, Christians and Buddhists, the ratios being 28·96, 17·54 and 25·41 against 30·37, 17·97 and 27·52 respectively in the previous year. Muhammadans, on the other hand, registered an enhanced death rate, namely 28·42 per thousand against 27·57 in the previous year.

Deaths in each month of the year.

In Bengal, December was the most unhealthy and August the healthiest month in the year 1912. In Madras the healthy months were March, April and May, while January was the most unhealthy. The death rate in the province of Bombay was the highest in November and lowest in June. In the United Provinces, April and May were the most unhealthy months and October the healthiest. In Bihar and Orissa, July was the month of maximum mortality and February that of least. As regards the Punjab, July was the healthiest and November and December the unhealthiest months. In Delhi the highest number of deaths occurred in April and the lowest in September. The month of May was the healthiest and the month of August the unhealthiest in Burma. In the Central Provinces April and May were the months of highest mortality and February the month with the fewest deaths. In Assam October was the most unhealthy month and February the healthiest. In the case of the North-West Frontier Province, November was the month of maximum mortality and July that of least. March was the most unhealthy month and October the healthiest in Ajmer-Merwara. In Coorg the deaths in June were two and a half times as numerous as those that occurred in December, the month of minimum mortality.

On the average of the last five years, February, June and July have been the healthiest months and November and December the unhealthiest. The greatest mortality occurred in December while the lowest was in February.

HOSPITALS.

Hospitals and dispensaries in British India are divided into six classes.

Class I—State Public; Class II—State Special,—(1) Police, (2) Forest and Surveys, (3) Canals, (4) Others—The first two classes include all institutions maintained from Provincial Funds and under Government management. The fact that an institution possesses endowments or receives contributions from local funds or private subscriptions is not regarded as a reason for not classing it as "State" so long as Provincial or Imperial funds are practically responsible for all the charges connected with it. Hospitals and dispensaries of the first class are open to all comers, while those coming under the second head serve only that special section of the public indicated in the sub-classification.

Class III—Local Funds.—This class includes all institutions the management of which is vested in local boards or municipalities or which are guaranteed or maintained by local or municipal funds. The fact that such an institution is aided by private subscriptions, or receives assistance from Government in the shape of part of the salary of the medical officer, grants of medicine, or otherwise, is not regarded as a reason for not classing it as a local fund dispensary, so long as its existence is practically dependent upon local funds.

Class IV—Private aided.—This includes institutions almost entirely supported by private subscriptions or guarantee, but receiving some aid from Government or local funds.

Class V—Private non-aided.—This class is comprised of institutions maintained entirely at the cost of private individuals or associations. The fact that Government provides a superior inspecting agency is not regarded as a reason for not treating an institution of this kind as "private non-aided."

Class VI—Railway Hospitals.—Comprises all railway dispensaries whether maintained by State railways or others.

These various classes of hospitals and dispensaries are divided into three groups for purposes of the tables in this Volume. The first group comprises State-Public (Class I), Local Fund (Class III) and Private-aided (Class IV) institutions the second group State-Special (Class II) and Railway (Class VI) dispensaries; and the third group represents Private non-aided (Class V) institutions.

The following table summarises the progress of these institutions during the last thirty-three years. (000 omitted.)

State-public, Local Fund and Private-aided Hospitals and Dispensaries in British India.

	1880.	1890.	1900.	1910.	1911.	1912.	1913.
Institutions	1,212	1,736	2,313	2,685	2,722	2,750	2,814

Surgical Operations performed (in thousands)	372	604	815	1,035	1,146	1,209	1,243
	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.	Rs.
Income (in thousands)—							
From Government	19,03	20,73	27,76	43,03	46,53	49,25	55,30
From Municipal and Local Funds	12,90	22,07	31,64	56,98	57,85	64,19	63,53
From subscriptions, endowments, fees, and other sources	5,02	5,69	13,36	19,52	26,05	25,16	23,94
TOTAL	36,95	48,49	72,76	1,19,53	1,30,43	1,38,60	1,42,77

Other Hospitals and Dispensaries in 1913.

	Institutions.	Patients.	
State-Special and Railway Hospitals	853	2,431	(in thousands)
Private non-aided Institutions	700	4,995	(in thousands)
	1,553	7,426	

From the above table it will be seen that the total number of institutions in the first group, *i.e.*, those described as General hospitals and dispensaries in the year 1880 was 1,212, in 1890, 1,736, in 1900, 2,313, in 1910, 2,685, and in 1913, 2,814; or in other words in 33 years the number of hospitals has more than doubled. Taking the figure of 1900 as equal to 100 the increase was one of 116 per cent. in 1910. Taking the same basis the increase recorded in 1913 was 122 per cent.

There were three main causes for the slow progress in early years—indifference on the part of the people, want of officers, and insufficient funds. During this period of thirty-three years the number of in-door patients increased from 217,000 in 1880 to 519,000 in 1913. But by far the greater increase is recorded among out-door patients, the number having risen from 7,192,000 to 30,163,000 during this period. The percentage of outdoor patients to the total population of the localities in which these institutions are situated has risen from 8·7 in 1900, to 11·5 in 1910, and 12·3 in 1913.

From these statistics it will be seen that surgery has grown to be a specially important part of hospital work, and the popular prejudice which at one time existed against it has been largely overcome. The number of cases of operations was only 372,000 in 1880 and is now 1,243,000. The income of these institutions has kept pace with the growth in the number of patients treated, and the receipts from all sources have risen from nearly 37,00,000 to over 1,43,00,000 lakhs within these 33 years.

The number of patients treated in the first group was 30,681,703 of which 518,824 were indoor and 30,162,879 outdoor patients. In the 2nd group the total number treated was 2,430,562 of which 98,460 and 2,332,102 were indoor and outdoor patients, respectively. In the third group there were 58,170 indoor and 4,937,050 outdoor patients treated, making a total of 4,995,220 patients. The total number of patients treated in these groups in 1913 was 38,107,485.

	Indoor.	Outdoor.	Total.
Bengal	89,721	5,448,741	5,538,462
Madras	107,865	6,978,413	7,086,278
Bombay	81,512	4,572,617	4,654.129
United Provinces	101,823	4,950,595	5,052,418
Bihar and Orissa	43,597	3,040,275	3,083,872
Punjab	96,923	5,077,724	5,174,647
Delhi	5,915	312,540	318,455
Burma	77,819	1,766,954	1,844,773
Central Provinces and Berar	18,652	1,943,715	1,962,367
Assam	13,761	1,710,145	1,723,906
North-West Frontier Province	26,391	1,123,281	1,149,672
Ajmer-Merwara	1,332	72,061	73,393
Baluchistan	7,424	342,918	350,342
Coorg	2,719	92,052	94,771
TOTAL	675,454	37,432,031	38,107,485
Percentage to Total	1·8	98·2	100

The number of indoor and outdoor patients treated in each province during 1913 is stated in the margin. Madras shows the largest number of indoor patients followed by the United Provinces, the Punjab and Bengal. In the three cities of Calcutta, Bombay and Madras 76,764 indoor patients were treated or 11·4 per cent. of the whole. 54,110 indoor patients were treated in hospitals for females, of whom 17,000 were treated in the 49 institutions of the United Provinces and 12,807 in the 26 hospitals of Madras, aggregating 29,807 patients or 55 per cent. of the total. In regard to outdoor treatment also Madras is ahead of any other province with about seven million patients, out of a total of over thirty-seven millions. Of the total number (1,153,730) of outdoor patients in hospitals for women, 379,465 (32·9 per cent. of the total) were treated in the United Provinces, and 260,189 in Madras.

The total number of beds available in 1913 was 47,498 divided in each group as follows. In the State-Public, Local Fund and Private-Aided hospitals and dispensaries the number was 23,505 for men and 12,810 for women. In the State-special and Railway institutions there were 6,618 and 256 respectively, and in the private non-aided institutions 2,358 and 1,951 respectively.

In 1913 there were 137 hospitals and dispensaries in group (1) containing 3,027 beds for women only, and there were in addition 9,783 beds available for women in other hospitals in this group. There were also 256 and 1,951 beds for women in hospitals in group (2) and (3) respectively. The total number of beds for females in British India was 15,017. In Bengal there were only seven hospitals for females and the number treated was 2,186.

	Number	Ratio per 1,000
Europeans and Eurasians—		
Males	126,857	97·7
Females	95,630	80·3
Hindus—		
Males	12,236,187	144·8
Females	5,048,618	62·1
Muhammadans—		
Males	7,125,456	238·7
Females	3,026,582	109·9
Buddhists—		
Males	543,601	103·6
Females	322,785	59·8

The marginal table shows the number of indoor and outdoor patients, according to class and sex, belonging to the principal religions treated in the hospitals in the first division or group during 1913 and the ratio per 1,000 of the population, male or female, of each class in British India. It is also interesting to note from the statistics below that Muhammadans as a class resort more freely to hospitals and dispensaries than Hindus.

Statement showing the indoor and outdoor patients treated in the State-Public, Local Fund and Private-aided dispensaries according to sex and reigion in each province in 1913 and the ratio to each thousand of population.

(a) Separate population figures for the Delhi Province are not available in the Census table for 1911.

The statistics of the principal diseases treated in all the hospitals and dispensaries in British India and the operations performed during the year 1913 are shown in the margin. Malarial fever is the malady most frequently treated in hospitals accounting for more than 18 per cent. of the total number of cases (31,151,436). Other diseases are shown in the order of the number of cases treated. Small-pox and cholera do not find a place in this list as the number of cases treated are comparatively very small. The number of the former during the year being only 7,585 and of the latter 33,410. During the year under review there were about a million and a half surgical operations performed in these institutions in British India.

	Number of cases.
Malarial fevers	5,462,401
Other diseases of the digestive system	4,513,525
Other diseases of the skin	4,018,016
Diseases of the eye	3,491,150
Ulcers	2,539,400
Diseases of the respiratory system other than tubercle of lungs	2,255,323
Diseases of the ear	1,874,118
Dyspepsia	1,329,001
Operations	1,449,580

The income of the State-Public, Local Fund and Private-aided hospitals and dispensaries in British India in the year 1913 was Rs. 1,42,77,024 as compared with Rs. 1,38,59,746 in the previous year. About 83 per cent. of this sum was derived from Government contributions (Rs. 55,30,249), from Local Funds (Rs. 36,82,727) and from Municipal Funds s 26,70,238). The remainder was mainly derived from interest on investments (Rs. 2,59,790) and from subscriptions (Rs. 10,66,361). Of this latter amount the sum of Rs. 2,72,581 was contributed by Europeans and Rs. 7,93,780 from Indians. In the last five years the receipts from Imperial or Provincial Funds, Local Funds and Municipal Funds have increased by 34·1, 7·4, and 20·9 per cent., respectively.

The expenditure in 1913 amounted to Rs. 1,40,72, 672, including three and a half lakhs invested. Of this amount a sum of Rs. 42,36,649 (30 per cent.) was paid as salaries and wages. Drugs and medicines cost Rs. 19,92,950 (14 per cent.), diet cost Rs. 13,76,838 (10 per cent.) and construction and repair to buildings accounted for Rs. 20,98,908 (15 per cent.).

LUNATIC ASYLUMS.

During the five years ending with 1913 the average asylum population was only 7,803. The number admitted into asylums in the year 1913 was 2,327, including 127 re-admissions. The year opened with 6,145 patients already in the asylums making the total population of these institutions 8,472. The average daily population was 6,613, of whom 5,209 were males and 1,404 females. The marginal table shows the distribution of the lunatics that were admitted into asylums in each province for the years 1912 and 1913, together with the ratio per 10,000 of the population. It will be seen that Bombay heads the list with 695 admissions in 1913 against 429 in the previous year. The United Provinces come next with 368 in 1913 against 406 in 1912. The ratio of lunatics who seek admission into the asylums is also greatest in Bombay being ·30 per 10,000 of the population in 1913; but very low in the United Provinces where the ratio is only ·08. In Burma the ratio is ·19, in the Punjab ·14 and in Assam ·11. The ratios are lowest in Bihar and Orissa (·03) and in Bengal (·05).

	Number admitted and re-admitted in		Ratio per 10,000 of population in	
	1912.	1913.	1912.	1913.
Bengal	265	213	·06	·05
Madras	260	293	·06	·07
Bombay	429	695(a)	·22	·35
United Provinces	406	368	·09	·08
Bihar and Orissa	72	90	·02	·03
Punjab	248	276	·12	·14
Burma	178	227	·15	·19
Central Provinces and Berar	74	91	·05	·07
Assam	66	74	·10	·11

In the Indian Census of 1911 only 67,978 persons were returned as insane in a population in British India of 244,194,918. Considering the relative positions of insanity and inmates in Asylums in British India there can be little doubt that only a very small percentage of weak minded persons seek admission into asylums. The cases admitted represent therefore, only an eighth of the insane population and the ratio per 100,000 of the population is infinitesmal. It is interesting therefore, to contrast these statistics with a few figures from other countries.

In the 67th Report of the Commissioners in Lunacy (1913) it is reported that in England 138,377 lunatics were under treatment, or 370 per 100,000 of the population. In Scotland there were 19,188 lunatics of which the Board of Commissioners had official cognizance or just over 400 per 100,000 of the population.

In Ireland in 1912 there were 24,839 insanes under care or in the proportion of 567 per 100,000 of the population. In the United States the figures are (in 1910) 187,000 lunatics or 204 per 100,000 of the population.

Of the lunatics in Indian Lunatic Asylums during the year 1913, 754 were discharged as cured, 303 were made over to friends, the majority having improved in condition, and 673 died during the year under report. Among the lunatics admitted in 1913 there were 285 Christians, of whom 183 were Europeans and Anglo-Indians, 1,238 Hindus, 512 Muhammadans, and 286 of other religions. The number of Christians greatly exceeds the ratio of Christians to the total population. The explanation of this is to be found in the fact that the insane amongst Christians seek admission into Asylums more freely, the reverse being the case with lunatics of other denominations in India.

(a) Including 287 patients (206 males and 81 females) transferred from the Colaba and Poona Lunatic Asylums to the recently opened Central Lunatic Asylum, Yeravda.

Of the total admissions 2,327 of all classes of lunatics during the year 1913, 452 were reported as criminals, the average of this class admitted in the last five years being 415 or nearly 22 per cent. of the total.

	1912.	1913.
Cultivators and labourers	584	596
Teachers, Students, and Writers	107	193
Mendicants and paupers	184	174
Traders and Shopkeepers	168	171
Domestic servants	120	139
Artisans	114	123
Soldiers	15	19

The previous occupations (as far as is known) of the lunatics who were admitted during the two last years under report are described in the margin. The only noticeable increase occurs under the heading of "Teachers, Students, and Writers" whose number rose from 107 in 1912 to 193 in 1913.

The prevailing forms of insanity in the asylum population in 1913 were stated to have been mania (3,394), melancholia (1,364), dementia (1,223), epileptic insanity (498), and idiocy (442). Regarding the ætiological factors in the patients admitted in 1913, 174 cases were attributed to heredity; mental instability and stress accounted for 539 cases, while 527 cases were reported as toxic.

The expenditure on the asylums, which averaged Rs. 10·99 lakhs during the five years ending 1912, amounted in the year 1913 to Rs. 23,38,122. The large expenditure was due to the inclusion of the cost of Rs. 10,15,271 for the building of the new Central Asylum at Yeravda in Bombay. Of the expenditure in 1913, the sum of Rs. 21,37,506 was borne by the State, the sum of Rs. 1,15,928 was obtained from fees, and Rs. 84,688 from other sources.

VACCINATION.

In 1880 an Act was passed for the compulsory vaccination of children only in municipalities and cantonments. The Act is now compulsory in all the municipalities and also in 193 villages and 70 ranges of the Madras Presidency. In Assam the Vaccination Act is in force in all municipalities except Barpeta, and also in the Sibsagar and Shillong stations and the Jorhat and Golaghat unions. In the United Provinces it is in force in all municipalities and cantonments, and in 40 notified areas but its provisions have been enforced in different places with varying degree of stringency. Vaccination is compulsory throughout the administrations of Ajmer-Merwara and Coorg. As regards the other provinces the number of towns or municipalities where the Act is in force is noted below.

Bengal in 112 towns or 94 per cent. of total.
Bombay in 113 towns or 56 per cent. of total.
Bihar and Orissa in 55 towns or 79 per cent. of total.
Punjab in 42 towns or 30 per cent. of total.
Burma in 53 towns or 84 per cent. of total.
Central Provinces and Berar in 53 municipalities or 47 per cent. of total.
North-West Frontier Province in 9 towns or 47 per cent. of total.

Vaccinations are conducted by the agency of a special department, established for the purpose and a very small proportion also by the staff attached to the ordinary hospitals and dispensaries. Each province has a large establishment of public vaccinators, with an inspecting staff under the Deputy Sanitary Commissioners. The staff employed in 1913-14 consisted of 22 European and 557 Indian supervising officers and 6,066 vaccinators, the latter including 2,278 licensed vaccinators employed in Bengal and Bihar and Orissa.

The table below shows the number of persons vaccinated, the number of deaths from small-pox, and the ratio of deaths per mille of population during the years.

	Number of persons vaccinated.	Population in which births and deaths were registered.	Deaths from Small pox.	Ratio of deaths from small-pox per mille of population.
1909-10	9,015,414	226,394,326	101,152	·45
1910-11	8,996,120	226,438,733	51,315	·23
1911-12	9,591,708	238,688,119	58,535	·25
1912-13	9,820,655	238,661,346	89,357	·37
1913-14	9,772,761	238,323,365	98,155	·41

The total number of persons vaccinated in 1913-14 was 9,772,761 against 9,820,655 in the previous year. Ten years previously, *i.e.*, in 1904-05 the number was 8,928,884 which represents an increase of 9·5 per cent. The ratio of persons vaccinated to the population of tracts where vaccination was in operation is 4 against 3·77 a decade ago. The primary cases by the special department numbered 8,614,128 in 1913-14 as compared with 8,670,865 in 1912-13 and the percentage of success was in these two years 96·9 and 96·5 respectively. Of the re-vaccinations, which increased from 1,061,408 in 1912-13 to 1,077,979 in 1913-14, 70·7 per cent. were successful against 71·8 in the previous year. Vaccination at dispensaries continue to decline, there having been 184,979 operations in 1913-14 compared with 187,450 in the previous year.

On an estimated birthrate of 40 per thousand of population, 46·8 per cent. of the children under a year old were protected by vaccination in 1913-14 as against 46·2 during the preceding year.

The cost of the special vaccination department in 1913-14 was Rs. 17,06,426, the average for the five years ending 1913-14 being Rs. 15,93,425. The bulk of the expenditure is defrayed from provincial, local, and municipal funds; Rs. 7,81,866 was contributed from provincial revenues, Rs. 6,58,471 from Local Funds, and

Rs. 2,38,130 from municipalities. The average cost of vaccination *per capita* works out at three annas and one pie in 1913-14. The cost per head was highest in Bomaby—8 annas and 9 pies, and lowest in Bihar and Orissa—1 anna and 1 pie only.

DEATHS FROM AND DESTRUCTION OF WILD ANIMALS.

During the decade 1904 to 1913 nearly a quarter of a million of human beings were reported to have been killed by wild animals. It is probable that many such deaths are not reported, and on the other hand it is also probable that a number of deaths are assigned to the action of wild animals which were not so caused. Of this number the majority, *viz.*, 219,076 persons died of snake-bite, and the remainder 20,828 persons were killed by other wild animals. The wild animals whose ravages are distinguished in the returns are the snake, the tiger, the leopard, the wolf, the bear, the elephant and the hyena. Among unspecified wild animals which destroy human lives may be mentioned the alligator and crocodile, wild pigs, buffaloes and wild dogs.

The average number of persons killed during successive quinquennia since 1876 is as follows :—

	Number.
Five years ending—	
1880	20,304
1885	22,357
1890	23,848
1895	23,979
1900	25,631
1905	24,757
1910	23,781
For the year—	
1911	26,210
1912	23,527
1913	23,373

The average annual mortality from snake-bite rose from 21,538 in the quinquennium ending 1908 to 22,277 in the last quinquennium. In 1913, there were 21,770 deaths from this cause against 21,461 in the previous year. The following provinces contributed to the increase—Bengal 4,491 against 4,471 in the previous year, Madras 1,695 against 1,530, Bombay 1,406 against 1,140, Punjab 899 against 793, Central Provinces and Berar 1,155 against 1,063, Assam 167 against 150, and Ajmere-Merwara 24 against 20 in the previous year. In the other provinces there was a decrease in mortality under this head, the United Provinces having recorded 5,166 deaths from snake-bite in 1913 against 5,214 in the previous year and Bihar and Orissa 5,640 against 5,816 in the previous year.

It is noticeable that there were in the year under review thirteen deaths from snake-bite for everyone caused by other wild animals, the number of deaths due to this cause being 21,770 against an aggregate number of 1,603 persons killed by other wild animals. After the snake the tiger is the most destructive beast and is responsible for 641 deaths, the leopard accounted for 236, and wolves and bears for 257. Elephants and hyenas were responsible between them for 74 deaths. Of the 395 deaths attributed to other animals 160 are assigned to alligators and crocodiles, 149 to wild boars and pigs, 20 to buffaloes, 44 to wild dogs and 22 to unspecified animals.

	Number.	Ratio.
Bihar and Orissa	6,186	179
United Provinces	5,303	112
Bengal	4,784	105
Burma	1,143	94
Central Provinces and Berar	1,280	92
Bombay	1,426	72
Madras	2,003	48
Punjab	909	46
Assam	269	40
Delhi	14	35

The marginal table shows the total number of persons killed by wild animals and the ratio of deaths per million of the population in the year 1913 in each province. Bihar and Orissa heads the list with a ratio of 179 per every million of the population. The United Provinces comes next with a ratio of 112 and then Bengal with 105. In Burma and the Central Provinces and Berar the ratio was above 90. In Bombay it was 72 while in the other provinces the ratio was 48 and below.

In the ten years dealt with in these tables the number of cattle reported to have been killed by wild animals was over a million (1,012,185). In the case of cattle the leopard is even more destructive than the tiger, and between them they are responsible for over 77,000 deaths out of a total of 104,838 in the year under review. Snakes accounted for 10,542 cattle and wolves for 9,304. Of the cattle destroyed by other animals 50 per cent. is ascribed to the ravages of wild dogs.

The statistics relating to the destruction of wild animals, especially snakes, are even more imperfect than those showing the deaths by such animals of human beings and cattle. In the year 1913 over 90,000 snakes were destroyed, the number destroyed in Bombay being 27,336 ; in Bengal 17,134 ; in Bihar and Orissa 16,784 ; in Burma 16,222. There were 24,630 other wild animals destroyed in British India. Of this number 6,638 were leopards, 3,859 wolves, 2,922 bears and 1,374 tigers. So far as the destruction of leopards are concerned Burma accounted for the largest number (2,588). Wolves were chiefly destroyed in the Punjab (2,033) and in the United Provinces (1,252). Burma also accounted for the largest number of bears (1,562) and of tigers (455).

G. FINDLAY SHIRRAS,
Director of Statistics.

DEPARTMENT OF STATISTICS, INDIA,
Calcutta, the 20th April, 1916.

(*a*) Exclusive of the population of certain areas in which the registration was not carried out

NOTE 1.—Variations in the figures for Bengal, Eastern Bengal and Assam, and the Central Provinces are due, in the main to the territorial changes in these provinces during 1905

NOTE 2.—Figures for Upper Burma have been included in these tables from 1906

VITAL STATISTICS

No. 4—DEATHS—NUMBER, and RATIO to POPULATION, of DEATHS, in BRITISH INDIA

Province		Population under registration	Area in square miles	Average population per square mile	Total number of deaths		Ratio of deaths in each 1,000 of population			Death rate in each 1,000 of population	
					Male	Female	Maximum for any one district	Minimum for any one district	Ratio for the province	Male	Female

NOTE.—These figures include criminal lunatics table No. 25

(a) Including 287 patients (males 206 and females 81) transferred from Colaba and Poona Asylums to the Central Asylum, Yeravda

(b) The actual figure representing the total population of the Asylum is 1,45[illegible] (males 1,170 and females 280.) The difference between this figure and 1,737 shown in the table is due to 287 patients transferred from Colaba and Poona Asylums to the Central Lunatic Asylum, Yeravda, having been taken into account in the Provincial report both under Colaba and Poona and Central Lunatic Asylums, Yeravda.

NOTE.—The difference between the number of operations and the number of persons vaccinated shown in Table No. 2 is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations but not to the number of persons vaccinated

(a) Includes re-vaccinations

(b) Excludes 1,867 operations performed in Tea Gardens in Jalpaiguri, the details not being available

No. 35.—COST (in rupees) of the SPECIAL VACCINATION ESTABLISHMENT in BRITISH INDIA, COST of each SUCCESSFUL CASE, and the SOURCES from which the EXPENSES were paid.

NOTE (1).—In Bengal the statistics show particulars of vaccination performed by vaccinators attached to Municipalities, Jails, Cantonments Railways, etc. The number of such vaccinators during 1912-13 and 1913-14 were 132 and 129. The average number vaccinated by each vaccinator in those years being 708 and 701, respectively. In other provinces the statistics relate to vaccinations performed by Civil Surgeons or medical subordinates attached to dispensaries as there are no special vaccinators attached to them

NOTE (2).—The difference between the number of operations and the number of persons vaccinated is due to second operations performed on account of failure on the first occasion; second operations, it may be explained, add to the total number of vaccinations, but not to the number of persons vaccinated

(a) No dispensary vaccination

(b) Includes re-vaccinations

No. 37.—TOTAL VACCINATIONS effected by the SPECIAL VACCINATION and DISPENSARY ESTABLISHMENTS (combined) in BRITISH INDIA

APPENDIX.

Resolution of the Government of India, Department of Education, Sanitary, Nos. 888-908, dated the 23rd May 1914.

Historical summary.

The Modern history of scientific sanitation in India may be said to date from the end of the last century. Previously there had indeed been periods of useful spade work and spasms of general sanitary activity. A Royal Commission, appointed in 1859 and reporting in 1863, recommended the formation of commissions of public health in the presidencies of Madras, Bombay and Bengal, with a view to the diminution of sickness in the army, and the improvement of the health of the general population. These commissions were appointed but were soon replaced in each presidency by a sanitary commissioner with an assistant. Sanitary inspectors general, afterwards called sanitary commissioners, were appointed in other provinces; and the sanitary and vaccination staffs were gradually amalgamated. In 1888, Lord Dufferin's Government issued a resolution drawing the attention of local bodies and village unions to their duties in the matter of sanitation; and sanitary boards were formed in every province. But comparatively little success attended these efforts except in the larger towns. On the one side, sanitary measures and systems of western countries were applied to India without due regard to the fundamental differences of western and eastern civilisations and of the conditions of life in tropical and temperate climates: on the other side, the people were unprepared for reform or any kind of change.

2. The ravages and horrors of plague and the discoveries resulting from medical research made some real impression on the educated community in India; and a demand gradually arose for sanitary surroundings and preventive measures, such as had not been known before. Individuals left their insanitary quarters for cleaner and healthier localities and in increasing numbers men began to realise the dangers to which they were exposed from existing conditions, and to appreciate the economic value of health and the wastefulness of sickness and premature death. Dislike of action was, however, for long persistent even among the educated. So far as the uneducated masses were concerned their apathy, fatalism and resentment of interference constituted a formidable obstacle to all sanitary progress.

Recent activity.

3. The governments in India have moved more rapidly of late. In 1898, the Government of India issued an important statement of policy. In 1908, imperial grants amounting to Rs. 30,00,000 (£200,000) a year were made to local Governments. A new department of the Government of India was created in 1910 in order to relieve the Home Department of education, sanitation and some other branches of the administration. In addition to sanitary conferences held by local Governments, three all-India sanitary conferences have been convened at Bombay, Madras and Lucknow, respectively, over which the Honourable Sir Harcourt Butler presided as Member of the Governor General's Council in charge of the department concerned. These conferences were attended by non-officials as well as officials, by laymen as well as professional sanitarians. Again, the Indian Research Fund Association has been founded to further the prosecution of research, and the propagation of knowledge and experimental measures generally in connection with the causation, mode of spread and prevention of communicable diseases. To this fund the Government of India make an annually recurring grant of 5 lakhs of rupees (£33,333). Moreover, since the constitution of the new Department of the Government of India, imperial grants have been made to local Governments and Administrations to the amount of Rs. 4,61,47,000 (£3,076,466), of which Rs. 55,23,000 (£368,200) are recurring, and Rs. 4,06,24,000 (£2,708,266) non-recurring. In addition, grants amounting to Rs. 82·33 lakhs (£548,866) a year have been made to district boards in certain provinces, a substantial portion of which will, it is hoped, be expended on rural sanitation. These grants have rendered practicable the execution of schemes which a few years ago seemed beyond the limits of financial possibility; and there can be little doubt that the movement for sanitary reform is now well established and progressive throughout the country.

4. There has thus been progress although the rate has hitherto been slow. In the land of the ox-cart one must not expect the pace of the motor car. The truly remarkable improvements effected of late years in the health of the army in India, in the case of Indian no less

than British troops,* cannot be expected in connection with the civil population. In the case of the army, the problem is concerned mainly with well nourished adults, all of whom are selected lives, living in sanitary surroundings, under military discipline. Moreover, so soon as a soldier becomes unfit for active service, he leaves the army and forms part of the civil population. In the case of the civil population, the conditions of the problem are very different, and sanitary reform has still to grope its way through a labyrinth of difficulties. In order to be successful it must conform to three cardinal principles :—

Cardinal principles.

(1) it must rest on a knowledge of the people, their conditions of life, their prejudices, social customs and habits, their surroundings and financial means ; and it must secure their co-operation ;

(2) it must recognise the diversity of local conditions in a country which includes numerous communities, castes and creeds and which exhibits almost every variety of climate, temperature, humidity and level of sub-soil water, from the deltas of Bengal with their steamy atmosphere and dense lush vegetation to the burnt brown hills of the north-west frontier ;

(3) its introduction must be preceded by preliminary local surveys, inquiry, or experiment.

5. As a result of the Plague Commission's Report Lord Curzon's Government took up with vigour the reorganisation of the sanitary department. Research institutes were started and an appointment of Sanitary Commissioner with the Government of India was created. The functions of this officer were to advise the Government of India upon sanitary and bacteriological questions, to settle with local Governments the principle on which an advance should be made and to organise and direct research throughout India. The arrangement was not completely successful. Among the disadvantages, the separation of research from clinical work deterred men from entering the department, and the office work in connection with research prevented the Sanitary Commissioner from undertaking wide and constant touring. The organisation was accordingly modified in 1912. The Sanitary Commissioner is now the independent adviser to the Government of India in all technical and sanitary matters, but all questions of personnel as well as the administration of the bacteriological department and research generally have been placed under the control of the Director-General, Indian Medical Service, with the Sanitary Commissioner as his staff officer.

Sanitary organisation.

6. The sanctioned strength of the superior sanitary organisation in India now is :—

(*a*) A Sanitary Commissioner with the Government of India.

(*b*) A bacteriological department comprising—

(*i*) thirteen laboratory appointments distributed as follows :—

Central Research Institute	1 Director	and 3 Assistants.
Bombay Bacteriological Laboratory	1 „	„ 2 „
King Institute of Preventive Medicine, Madras	1 „	„ 1 Assistant.
Pasteur Institute, Kasauli	1 „	„ 1 „
Pasteur Institute, Coonoor	1 „	„ 1 „

(*ii*) fifteen new appointments recently sanctioned for the prosecution of research work and direct investigation in the field.

In their resolution, dated the 23rd May 1912, the Government of India provided for a large increase in the number of Deputy Sanitary Commissioners and for the appointment of health officers (of the first-class for larger municipalities and of the second-class for the smaller towns) on the lines of detailed proposals received from local Governments. Twelve additional appointments of deputy sanitary commissioner, thirty-five appointments of health officer of the first-class and a large addition to the number of second-class health officers were sanctioned in 1912 and 1913; the entire cost of the additional deputy sanitary commissioners on the basis of the scale of pay fixed for Indians and half the cost of the health officers being met by imperial grants. The Government of India also advised local Governments to take powers, where these did not exist, to require a municipality to appoint a health officer and to veto the appointment of an unfit person. Such powers already exist in the Bombay presidency, and have recently been taken by legislation in Bengal. Simultaneously, the Government of India recommended the system in force in Madras whereby every municipality is required to employ one or more trained sanitary inspectors in proportion to population. Sanitary inspectors are now being employed in large numbers in towns. In addition, the civil surgeon in every district is the sanitary adviser of the local authorities and in most provinces controls the vaccination staff. The provision of an increased staff of sanitary engineers is engaging urgent attention.

The Government of India attach great importance to the organisation of voluntary agencies and have recently made a grant of Rs. 20,000 (£1,333)—a sum equivalent to that given by the Bombay Government—to the Bombay sanitary association, which was founded in 1903, and now has corresponding branches in several districts and native states.

7. The policy of the Government of India is to keep the control of research under itself, but to decentralise other branches of sanitation. The creation of an imperial department is no departure from that policy, and the large imperial grants already mentioned have been made without any interference with provincial Governments. While the general direction of a policy of public health must remain with the central Government, all detailed control and executive action are, and will be, left to local Governments. The Sanitary Commissioner with the Government of India is a touring officer empowered to consult and confer informally with local Governments and their officers upon matters connected with sanitation. He is not permitted to encroach upon the authority of local Governments over the officers under their control.

(a) Appointments of health officer in presidency towns and Simla are not included.

(b) Five of these are temporary appointments.

(c) In addition to the officers shown in this statement, the Director, Vaccine Institute, Belgaum, is also a sanitary officer.

(d) There is also a temporary appointment.

(e) Temporary.

(f) One of these is temporary.

(g) The administrative Head of the medical department is also the Sanitary Commissioner.

(h) There are also four 3rd-class health officers in the province.

(i) The Sanitary Commissioner with the Government of India is also Sanitary Commissioner, Delhi.

(j) Two of these are temporary.

8. The position of provincial sanitary commissioners towards the administrative heads of the medical department varies somewhat in different provinces. The Government of India do not wish to interfere with the arrangements which local Governments may consider best suited to local conditions, but they desire to insist on the importance of defining the functions of the two officers and securing to the sanitary commissioner the position of responsible technical adviser to the local Government in all matters affecting public health.

9. In every province, sanitary boards have been composed with varying powers, some being merely advisory, others having authority to sanction schemes and allot funds. These boards are composed of officers belonging to the medical, sanitary, engineering and other branches of the civil services with the addition of non-officials. The Government of India view with favour and confidence the devolution of financial authority and responsibility to these boards, and they commend to local Governments the appointment of a permanent salaried secretary to the board where this has not been done. They believe that such an appointment, wherever made, has resulted in an increase of efficiency.

10. Arrangements for training the superior sanitary staff are now engaging the attention of the Government of India. The chief difficulty at present is to provide courses in practical hygiene and in the study of the bacteriology and etiology of tropical diseases. It is hoped in the near future to make arrangements in India for the former and to utilise the schools of tropical medicine at Calcutta and elsewhere for the latter. Meanwhile a British diploma in public health is required from candidates for the post of deputy sanitary commissioners and health officers of the first-class. The problems of public health in India are vitally complicated by the fact that biting insects are a prominent factor in the dissemination of disease, and it is obviously desirable to provide in India, as soon as possible, a complete course of training for sanitary officers.

Training of staff.

Training classes for sanitary inspectors are now held in all the more important provinces.

11. A substantial beginning has thus been made for the development of a department of public health and Indians have been freely enlisted for it. The posts of deputy sanitary commissioner and health officer are now open to Indians. Nine deputy sanitary commissioners out of 26 and the majority of health officers are Indians. The new bacteriological department consisting of 28 officers is also open to duly qualified Indians.

As health officers and sanitary engineers gradually relieve deputy sanitary commissioners of much of the drudgery of inspection and routine work, it is hoped that the latter will be set free to deal with epidemics and communicable diseases from a higher plane, and to consider issues of public health wider than those which they are able to review to-day. It is, therefore, important to provide in advance free interchange between them, the laboratory workers and those carrying out practical research in the field.

12. Research is slowly lifting the veil which hides the secrets of disease and mortality and opening up fields of inquiry scarcely thought of a generation ago. The discovery by Sir Ronald Ross of the part played by the mosquito in the communication of malaria and the appointment of the Plague Commission in 1898 are landmarks in the history of Indian Sanitation. In 1902, a research institute was founded at Guindy in Madras, named the King Institute after Lieutenant-Colonel King, C.I.E., I.M.S., in view of his devoted efforts in the cause of sanitation in that presidency. In 1905, Lord Curzon's Government summed up the position and the policy of the Government of India in regard to the establishment of laboratories for the study of problems of public health in India. The functions of the central laboratory were original research, the preparation of curative sera and the training of scientific workers. The functions of the provincial laboratories were diagnosis and special research connected with local conditions. This policy has been steadily developed. The Central Research Institute has been established at Kasauli. The Plague Research Laboratory at Parel has been extended and re-equipped and is now the bacteriological laboratory for the Bombay presidency; and a proposal is under consideration to attach to it a school of tropical medicine. A research laboratory and school of tropical medicne are under construction at Calcutta. Pasteur Institutes exist at Kasauli and Coonoor. A third is about to be established in Burma, and it is under discussion to establish others in Assam (where it will be combined with a research laboratory) and Bombay.

Research.

Besides the routine work connected with the bacteriological diagnosis of disease, anti-rabic treatment, the manufacture of various vaccines and sera and general research, these laboratories at different times have been the centres of many special investigations, notable amongst which are those on plague and enteric fever. It is hoped that before long each province in India will have a laboratory fully equipped for research.

13. The foundation of the Indian Research Fund Association in 1911 has marked an important era in sanitary progress. The control and management of the association are vested in a governing body, the president of which is the Member in charge of the Education Department of the Government of India. The governing body is assisted by a "scientific advisory board" of which not less than three members have seats on the governing body. They examine all proposals for work in connection with the scientific objects of the association and report as to their importance and feasibility. The members of this board are appointed

Indian Research Fund Association.

for one year, but are eligible for re-election, and they have power to add to their number. The present members are the Director-General, Indian Medical Service, the Sanitary Commissioner with the Government of India, the Director of the Central Research Institute at Kasauli, the Officer in charge of the Central Malarial Bureau and the Assistant Director-General, Indian Medical Service (Sanitary): Sir Ronald Ross has been elected an honorary consulting member. The membership of the Indian Research Fund Association is open to non-officials. Every donor of Rs. 5,000 is entitled to become a permanent member, while every subscriber of Rs. 100 per annum can be a temporary member. Members of the association are entitled to attend and take part in the annual general meeting of the association and to receive copies of the reports and other publications issued from time to time by the association. Although, so far, the fund has been financed solely by the Government of India, it is hoped that in time Indian philanthropists will contribute towards the expansion of the association by founding chairs of research, by financing experimental research measures and otherwise.

14. The association has been active and can already point to some achievement. Out of an income of Rs. 15 lakhs (£100,000) received since its incorporation and up to the end of 1913-14, an expenditure of over Rs. 14 lakhs (£93,333) has been sanctioned. In 1911, Major S. P. James, I.M.S., was deputed to study yellow fever in its endemic area and to draw up proposals for protecting India against the introduction of the disease. Those proposals are still under consideration. In the meanwhile, stegomyia surveys have been carried out in Calcutta, Bombay, Madras, Karachi and Rangoon and other seaports. Anti-malaria schemes based on preliminary surveys have been carried out at a cost of Rs. 6,02,000 (£40,133). Investigations are at present in progress into the problems connected with the prevalence of cholera, kala-azar, dysentery, leprosy and goitre, as well as inquiries into the pharmacology of cinchona derivatives, the use of hydrocyanic acid gas as a pulicide and the fixation of chemical standards of purity for milk and milk products Other investigations are under consideration regarding bacteriological standards of purity for water-supplies, the different anti-cholera vaccines and sera, the methods of water filtration and silt removal best suited to Indian conditions, and the etiology of diabetes and the fevers of short duration. These will be started so soon as more trained research workers are available. It is hoped also to carry out, during the next non-epidemic season, an experiment in plague prevention on a large scale on the lines indicated in paragraph 22.

15. Besides financing the investigations conducted by its own staff, the association gives grants-in-aid to outside research on approved lines. The co-operation of other workers has been sought, and every encouragement has been given to them. Grants for research have been made, for instance, to Professor MacMahon, Dr. Hossack and Mr. Howlett. The services of Indians have also been enlisted. Dr. Korke is engaged in an important investigation into kala-azar, while Mr. Awati, a medical entomologist, is employed under the association. The Government of India cordially approve the policy of encouraging private enterprise in the cause of research.

16. The association has also started a journal for the publication of medical research work done in India—the "Indian Journal of Medical Research"—published quarterly. The favourable reception which has been accorded to the first three numbers is evidence of the increased interest that is being taken in sanitary science in India to-day.

17. The investigations enumerated above represent the work directly under the supervision of the Government of India. The Local Governments also are fully alive to the importance of research, and in seven provinces nine special officers are at present engaged in investigating the causes underlying the local prevalence of malaria and devising suitable schemes for the mitigation of that disease.

Malaria.

18. It remains to consider the results of research as applied to the chief tropical diseases, always remembering that they are liable to revision or modification in the light of further investigation and discoveries. The most important tropical disease is malaria. After allowance has been made for the tendency to attribute to fever deaths from other causes, malaria stands out as universally prevalent in India and in many tracts is a scourge far greater than either plague or cholera. It maims as well as kills and causes more sickness, misery and death than any other single disease. Measures for the prevention of malaria aim at breaking the cycle of infection in two ways, (*a*) by attacks on the parasites in man, and (*b*) by the destruction of mosquitoes. To the former class belong the different systems of quinine prophylaxis and treatment; and to the latter, all those measures which aim at abolishing mosquito breeding grounds. Both methods have been successful in other countries and both have been tried extensively in India. The following propositions represent the experience gained up to date:—

(1) The conditions and causes underlying the prevalence of malaria vary greatly in different places, and no one anti-malarial measure is suitable for all.

(2) Quinine both as a prophylactic and curative agent is of great value to the individual. Its powers of saving life, alleviating sickness and destroying sources of infection cannot be over-estimated. There should be no relaxation in the efforts to educate the people in the use of the drug: and its sale by shopkeepers in rural areas might well be encouraged.

(3) The regular administration of quinine to children in schools during the malarial season is a practical measure of easy application and of proved utility, it is valuable alike for its immediate good effects on the health of the scholars and as a means of spreading knowledge of the use of quinine.

(4) In any community under control quinine prophylaxis properly carried out is a valuable weapon in the fight against malaria: in India with its free population, the ignorance and apathy of the masses, their prejudice against the drug, their objection to medicine when not actually suffering from illness, and the fact that it must be continued over an indefinite number of years, greatly limit the value of quinine prophylaxis.

(5) In anti-larval operations it is not necessary to abolish all breeding grounds of mosquitoes, even of known carriers of malarial infection: a marked amelioration in health conditions will ensue if the chief breeding grounds of the malaria carrying mosquitoes are cleared.

(6) Malaria surveys have brought to light important and unexpected facts regarding the causation of malaria in particular localities. For instance, the enquiries of Major Liston and Dr. Bentley in Bombay disclosed the fact that malaria did not arise from the swampy surroundings of the city and that the malaria-carrying mosquito was *N. stephensi* which bred in the numerous wells attached to private houses. Again, Major Christophers has demonstrated that malaria in the Andamans is due to a species of mosquito *M. ludlowi* which breeds in the brackish water of the creeks and that the mosquitoes infesting the rice-fields in the neighbourhood are innocuous.

(7) Notwithstanding the initial expense, those anti-malarial measures should be chosen which will act automatically, be independent of outside help and permanent in their effects: those which require regular repetition, constant attention or active co-operation on the part of the people, are, under present conditions, seldom durably effective.

(8) The treatment of permanent collections of water is important whether it be effected by (*a*) water tidiness, through sloping of banks and clearing of weeds, or (*b*) stocking with fish of proved utility as mosquito destroyers, or by both methods.

19. The Government of India have arranged classes for instruction in practical malaria work twice a year. The course is so planned that each member of the class takes an actual part in the preparation of a malaria survey which will eventually be the basis of a practical scheme of malaria prevention. Already 155 medical officers in civil and military employ have passed through the classes. It is hoped before long to spread a large number of trained and active workers over the whole of India.

The Lucknow Sanitary Conference recommended that a malariologist and engineer should be deputed to Italy to study the methods of "colmate" and "bonificazione" under the auspices of the Indian Research Fund Association, and it is hoped to arrange for their deputation. The effect of silt deposit on the malarial conditions of deltaic areas in India is also receiving attention; and interesting experiments are being conducted by the Government of Bengal at Berhampur. Experiments in clearing jungle and undergrowth will shortly be undertaken.

Plague.

20. The Plague Research Commission, which was constituted in 1905 and is still continuing its investigations, has thrown much light on the etiology and epidemiology of the disease. The chief conclusions that have been reached so far may be summarised as follows:—

(1) In India, where the pneumonic form of the disease is relatively rare, plague is essentially a disease of rats communicable to man and a few of the lower animals; an epidemic amongst men is directly dependent upon an epizootic amongst rats.

(2) Plague spreads from rat to rat and from rat to man through the agency of the rat flea.

(3) The plague bacillus under natural conditions does not long retain its vitality outside the body of the rat, the rat flea, or man.

(4) Plague has a definite seasonal prevalence, generally constant for any given place but varying in different parts of India; investigation shows that the plague season coincides with the season of maximum prevalence of rat fleas.

(5) Infection is carried from place to place only over very short distances by the spontaneous movements of rats: in other cases, infection is carried either (*a*) by the agency of man or personal effects acting as a means of transport for infected fleas, or (*b*) by means of merchandise, chiefly grain, which may contain rats as well as fleas. It is not yet established which of these two agencies is the more important, but recent work, both in India and the Far East, has emphasised the importance of grain as a vehicle for the transmission of infection

(6) In comparatively few places in India does plague infection survive the adverse conditions of the non-epidemic season: such places are usually either (*a*) large towns, or (*b*) places which have been infected late in the epidemic season.

(7) In places which have suffered from repeated and severe epidemics of plague, the rats have become less susceptible to plague than are the rats in places which have remained plague-free or have suffered but slightly.

21. These conclusions have been arrived at after much careful and painstaking research and constitute a great advance on the knowledge of plague, which was available when, in 1896, it first appeared in Bombay. They point, apparently, to a simple solution of the plague problem—no rats no plague. But this solution is not attainable unless the population concerned is convinced of the danger of living in close association with the rat and is ready to co-operate in its extermination. Unfortunately, attempts at rat destruction by trapping or poison frequently meet with active opposition. Experience in India suggests that owing to the excessive fecundity of the animals, general rat destruction, even when applied to extensive areas, gives only a temporary reduction of rat infestation and has a limited sphere of usefulness as an anti-plague measure.

22. In one direction, however, well directed efforts at rat destruction may prove useful. In each epidemic a number of places are infected late in the season and in certain of these plague survives the non-epidemic period only to break out in a virulent form when the conditions of spread again become more favourable. These localities are potential foci of extensive infection. It would seem important to concentrate the energies of the plague preventive staff on them in well organised schemes of rat destruction carried out during the quiescent period before the commencement of the next epidemic season.

23. Much can be done, indirectly, to reduce the number of rats in towns and villages, by diminishing their food supply. In any place the number of rats is in proportion to the quantity of food which they can obtain. Efficient scavenging and the protection of foodstuffs from the depredations of rats are important from this point of view. The markets, grain stores, and shops, in most parts of India, are so placed and constructed as to give food and shelter to large numbers of rats. Experiments are being carried out with a view to discovering the best practical means of disinfecting grain stores and godowns. It is not practicable at present to remove grain markets and godowns outside towns, to prevent them from being used as dwellings for men, to insist on solid masonry buildings, or to prohibit the stabling of horses and cattle in the precincts of dwelling houses. But these measures and the storage of grain in bulk instead of in bags may, with the progress of education, hereafter enter the zone of practicability. The exclusion of rats from houses is important. In several provinces experiments with different types of so-called rat-proof houses have been made with varying degrees of success. The results suggest that no form of house could remain rat-free for long in India owing to the habits of the people. Even were this not the case it would obviously be impracticable, for financial reasons, to render dwelling houses in the towns and villages of India rat-proof on anything like a large scale. On the other hand, the individual can protect himself by providing his house with masonry floors and walls and windows enough to give ample light and air to every room and by preventing accumulations of rubbish amongst which rats can build their nests. The rat requires shelter for breeding, is mainly nocturnal in its habits and prefers darkness to light.

24. Three other measures remain to be considered—evacuation, disinfection and inoculation. The evacuation of all houses in large towns, on the occurrence of rat mortality therein or human plague cases in adjacent dwellings, is rarely possible, but in villages and parts of smaller towns it is a valuable means of checking an epidemic of plague. Disinfection to be efficacious should be directed against the rat and the rat-flea. It is of little value when it leaves both untouched. The practical objections to compulsory inoculations with anti-plague vaccine on a large scale continue; but the safety and efficiency of inoculation as a personal preventive measure against infection has been abundantly proved, and in certain areas the prejudice against it appears to be diminishing. The Government of India desire that every facility should be afforded to any one wishing to obtain this protection for himself or his family and they commend to local Governments the employment of carefully selected private practitioners to this end.

Cholera.

25. Cholera is now much less prevalent than formerly, but frequently occasions severe epidemics and still remains a constant cause of mortality. Epidemics have in several recent cases been traced to pilgrims returning from places of religous pilgrimage, at which there had been no recognised outbreak of the disease. In 1912, Major Greig was deputed to make a special investigation of the whole subject. That investigation, which still continues, has added to knowledge regarding the propagation of cholera and has established the fact that not only cholera convalescents, but also healthy persons who have been in contact with cholera cases, can act as "carriers" of the disease. It has also been shown that the germs of the disease can be recovered from a patient's dejecta kept under natural conditions for a variable but frequently considerable period, and that flies may play an important part in the dissemination of infection. These observations, while in no way opposed to previous knowledge that cholera is a water-borne disease, accentuate the importance of careful and thorough conservancy,

Small-pox.

26. Small-pox is not a tropical disease, but it used to be so rife in India as to be associated among Hindus with its own special goddess. It now occupies a small place in the mortality returns. This result is due to the spread of vaccination during the latter half of the last century.

Vaccination.

Formerly, nearly all vaccination was effected by human lymph, but within recent years arm-to-arm vaccination has been steadily replaced by the use of pure glycerinated or lanolinated calf lymph. The change has been doubly beneficial; it does away with the necessity of breaking the vesicle in the child's arm, a simple operation but one which exposes the wound to contamination by extraneous germs; and it ensures that the vaccination is effected with a pure and fully potent lymph with consequent increase of protection. The change has been especially welcomed by educated Indians. Madras, Bombay, Bengal, Burma, the United Provinces, the Punjab, the Central Provinces and Assam have each now their own calf lymph depôts, and the opening of another for the province of Bihar and Orissa is under consideration. Grants of Rs. 2,00,000 (£13,333), were given from imperial revenues last year to improve the depôts in the United Provinces, the Punjab and Burma, and to establish the new depôt in the Central Provinces.

Tuberculosis.

27. The prevalence of tuberculosis throughout India especially in the large cities is undoubted. In some of the latter, the mortality exceeds that of certain crowded European cities. The difficulties of coping with the disease in India are immense and demand the fullest co-operation between Government and private agency. One or more officers will be detailed to investigate the causes underlying the disease, to organise the diffusion of information, and to advise regarding measures for the prevention of infection: the services of Dr. Lankester have already been secured by the Indian Research Fund Association for this purpose. Recent research appears to show that tuberculosis in India is chiefly human and not bovine in origin. Indian cattle so far as is known are practically free from the disease, and Indians do not as a rule drink unboiled milk. The source of the disease is in the homes of the people, and the relief of congested areas and the provision of sufficient light and air in human tenements are preventive measures of great value. The Government of India invite attention to the recommendation of the Lucknow sanitary conference that circumspection should be exercised before instituting at considerable cost further large sanatoria. They consider that inexpensive buildings suitable as model dwellings for the people may prove of great educative value and they desire to encourage tuberculosis hospitals and dispensaries. They also take this opportunity of communicating the warning of the Lucknow conference against the indiscriminate use of tuberculin by unqualified medical practitioners.

Infant mortality.

28. No summary of public health is complete without a reference to infant mortality. In 1911, of 4,752,152 male children and 4,457,551 females born in India, 1,016,823 males and 873,677 females died. In other words, about one-fifth of the children born died within the first year of their life. It is difficult to arrive at the actual causes of this high rate of mortality. The figures at the disposal of Government are often of doubtful accuracy, and the comparison of figures from different localities is frequently fallacious. On a broad view of the subject the causes of infant mortality may thus be summarised: (1) malaria operating both directly on the infant and indirectly through the mother; (2) diseases due to insanitary surroundings and exposure to infection especially through the medium of flies; (3) diseases due to ignorance on the part of the mother with regard to the feeding and care of the infant; (4) accidents of child birth and diseases attendant thereon. For (3) and (4) the custom of early marriage and the primitive and insanitary methods of midwifery are largely responsible. The latter lead directly to the death of the infant from tetanus and other diseases, and indirectly increase the infant mortality by depriving children of their natural nourishment either through the death of the mother or the failure of her milk as the result of sepsis. Deficiency in the supply of cow's milk has not been proved to be a predominant cause of infant mortality in India; but the question of improving both the quality and the quantity of the milk-supply without increasing its cost is engaging earnest attention (*vide* paragraph 42).

It is hoped that the instruction of mothers and midwives will engage the attention of all medical women practising in India and especially interest the women's medical service which has recently been established. In some of the large cities in India, notably Calcutta, Bombay and Madras, nurse health visitors have been appointed by municipalities to visit the people in their homes and assist and instruct mothers in the elementary principles of hygiene. In Bombay, an interesting experiment has been started by Dr. Turner in the form of lectures to the midwives. Another is likely to be made under the auspices of the Indian Research Fund Association in Delhi, where it is proposed to detail two trained nurses for work as health visitors.

Vital statistics.

29. The course of sanitary reform is much impeded by the want of complete and accurate vital statistics. Without them it is difficult to gauge the effects of sanitary measures or to convince people of their efficacy. The difficulties in the way of improving the reporting and recording agency especially in rural areas are great; but systematic checking and supervision

of returns should yield good results. Dispensary returns and voluntary notification by private medical practitioners are useful as checks but are only partial in their scope. A comprehensive scheme for the improvement of general reporting is required. The Government of India invite the attention of local Governments to the importance of the subject.

30. The Government of India recognise that differences in local conditions preclude the issue of any general instructions but they commend the following propositions for consideration :—

(*a*) The reporting of vital occurrences should not be left exclusively to the municipal staff; reporting by the head of the household also should be insisted on. The two reports would then be available to check one another.

(*b*) The actual registration should be done not as an extra duty but by special registrars who should, if possible, possess a medical qualification. In the case of deaths, inquiries regarding the symptoms of the deceased could then be made from the person reporting and some check on the diagnosis of the cause of death could be obtained. Many people are attended during their last illness by unqualified persons or die without medical attendance.

(*c*) The registrar should be required to verify at least 10 per cent. of the reported births and deaths and this verification should, as far as possible, include all particulars such as cause, date, age, sex, place, etc.

(*d*) The health officer should be in charge of the vital statistics in the town and should be responsible for supervising and checking the work.

(*e*) Experiments might be made in obtaining accurate registration in typical areas by means of a special staff which would also be employed in healing the sick.

Sanitary surveys.

31. Concurrently with attention to the registration of vital statistics the Government of India commend to local Governments the importance of sanitary surveys on broad lines. Something has been done in this direction and valuable reports have been drawn up, giving the real health conditions of towns and particular localities and indicating the existence of any special sickness or mortality and the definite causes underlying them. The Government of India desire that systematic working plans should be drawn up where this has not already been done with a view to mapping out the sanitary conditions of all the more important towns and localities in which sickness or mortality is above normal. This will occupy years of steady preparation; but as deputy sanitary commissioners are relieved of much of the routine work which at present they have to perform they should be able to carry this undertaking to a successful issue. The preparation of drainage surveys in towns in advance of needs obviates waste in the long run. In the absence of such surveys, work is often commenced in a haphazard way without due consideration of a scheme as a whole.

Urban sanitation.

32. Urban sanitation has as already observed, received much attention of late years. It falls generally under four heads, *viz.*, conservancy, water-supply, drainage and town-planning with improvement of housing and the relief of congested areas. In the forefront of these stands conservancy.

Conservancy.

33. The importance of efficient scavenging with speedy and complete removal of all night soil and rubbish from the vicinity of habitations and its satisfactory disposal can scarcely be exaggerated. Yet probably no department of public health work is more neglected in many Indian towns. The strict rules of the caste system have for centuries relegated everything connected with this work to the outcast, and the people, as a rule, evince little if any interest in the conservancy even of their own houses. To this neglect must be attributed the plague of flies which at certain seasons is experienced in every Indian town. Apart from the discomfort which they cause, flies are known to be the disseminators of many diseases, including cholera, enteric fever, turberculosis, dysentery and diarrhœa and are largely responsible for the heavy mortality amongst infants. The all-India sanitary conferences at Madras and Lucknow drew prominent attention to the danger to health caused by the presence of these noxious insects, and the results of the recent "anti-fly" campaign at Delhi suggest that a large reduction in the number of flies is by no means an impossible task.

34. Whether incineration or shallow trenching or either of these methods of conservancy combined with water carriage is the best in any particular case will depend very largely on local conditions and customs. With the extension of drainage and sewerage systems, water carriage of all night-soil, with ultimate disposal on sewage farms, should give the best result. In the majority of towns, however, it will be long before this is generally practicable and the choice rests between incineration and trenching. Of the two methods incineration is safer and on this account, if conditions permit, is preferable. Trenching is often thought to be more economical; but the profits obtainable from the trenching or pitting of night-soil and sale of the poudrette disappear, or are largely reduced, when the expense of carriage and supervision is taken into account. The material consideration in all cases is that the removal and disposal should be prompt. As education spreads and the number of health officers and sanitary inspectors increases, improved results may be anticipated.

Water-supply.

35. Few subjects have received more attention of late than the provision of a piped supply of filtered water in towns. Complete figures are not available but sums amounting to at least Rs. 3,51,58,297 (£2,343,886) have been spent during the last 20 years on completed schemes. Projects costing Rs. 1,40,03,433 (£933,562) are under construction and projects costing Rs. 1,14,44,750 (£762,983) have been prepared and sanctioned. These figures are exclusive of the expenditure in the presidency towns and Rangoon.

36. The demand for piped and filtered water-supply grows, and is likely to grow more rapidly in future. While recognising the need for treating the question with due regard to local conditions, the Government of India offer the following general observations:—

(*a*) When piped water-supplies were first introduced, in the face of opposition, it was necessary that the charges should be made as low as possible. That stage has now been passed, and there appears no good reason why water-supplies should not be conducted on a business footing and the water charged for like any other commodity. An interesting discussion on the financing of water-supplies was introduced by the Honourable Mr. Curtis at the Madras sanitary conference.

(*b*) On the whole, the provision of piped filtered water in towns has not been followed by that reduction in water-borne disease which might have been expected. This is probably due in most cases to the large number of wells, both public and private, which still remain in use. The closure of many of these wells is much to be desired, but the owners are unlikely to consent to this so long as the piped supply is intermitent and is drawn off hot or unpleasantly warm during the summer. In any case the substitution of a constant for an intermittent supply will shortly have to be considered as pipes get older and insuction declares itself. The warmth of the water is more difficult to deal with, but much might be done by burying pipes deeper in the ground and carrying house pipes inside instead of outside houses.

(*c*) Excessive wastage is common and causes not only an unnecessary burden on the municipality but frequently also a defective supply in the higher portions of the distribution. The employment of a regular waste-detection staff has in most cases been found to make for economy and efficiency.

Drainage.

37. Drainage schemes, on modern lines, are the basis of all sanitary improvement in urban areas. The demand for them is scarcely less than that for piped water and is steadily on the increase. And in the case of water-supply complete figures are not available but the known expenditure during the last twenty years has been considerable and is now rapidly increasing. The expenditure on completed works outside the presidency towns and Rangoon during that period amounted to Rs. 97,65,049 (£651,003) whereas the cost of the works under construction is estimated at Rs. 1,54,20,502 (£1,028,033). In the beginning precedence over drainage was given to piped water-supply but experience has demonstrated the advantage of introducing both concurrently. Without drainage there is no means of carrying off the surplus water and without piped water-supply it is difficult to flush the drains properly.

38. When drainage schemes on modern lines were first started in this country there seems to have been a bias against the use of sewers and, wherever possible, open drains were adopted. Experience has shown that the preference for the open drain, and the fear that sewers would give excessive trouble, were not well-founded. On the contrary, much of the advantage of a drainage system is lost if only open drains are used, as the old system of hand-carriage latrines has to be continued. Moreover, economy in establishment is possible only in the case of a sewerage system.

Epidemic diseases.

39. The Government of India desire to invite the attention of local Governments to the importance of providing adequate facilities for the isolation of cases of epidemic diseases. The isolation of individuals suffering from infectious diseases is often desirable and sometimes necessary, and it would seem desirable to have in every important municipality a small well-built segregation hospital in charge of a qualified medical practitioner, who might be one of the medical registrars for vital statistics.

A revised set of regulations under the Indian Ports Act for the prevention of the spread of infectious and contagious diseases is under consideration.

Pilgrim centres and pilgrimages.

40. Pilgrimages necessitating as they do the collection of large numbers of persons, often more than a million, at one place at one time have an important sanitary aspect mainly in connection with cholera (*vide* paragraph 25) and other communicable diseases. The Government of India recently decided to examine the sanitary arrangements at the chief places of pilgrimage throughout India and local Governments were asked to appoint provincial committees for this purpose under the presidency of the Sanitary Commissioner with the Government of India with a view to formulate practical schemes of improvement. The inquiry is still in progress but the Government of India have already made a grant of Rs. 2 lakhs (£13,333) and promised an additional grant of 4 lakhs of rupees (£26,666) spread over four years towards the improvement of the pilgrim route to Badrinath; and they have made a further

recurring grant of Rs. 20,000 (£1,333) a year for the same object. The important question of improving the conditions of the pilgrimage to the Hedjaz by Indian Musulmans is undergoing close scrutiny. The Governor-General in Council anticipates that these inquiries will lead to signal sanitary improvements and promote the convenience and comfort of many millions of His Majesty's loyal Indian subjects.

Adulteration of food and drugs.

41. The adulteration of food and drugs is common and has an important bearing on public health. Provisions for dealing with adulteration of food-stuffs exist in most municipal enactments in India, but these are confined to municipal areas and are restricted in their operation. Bombay and the United Provinces have special laws dealing with the question. The Government of India have recently enquired from local Governments as to the desirability of legislation, imperial or provincial, on the subject. The question is not free from difficulty as, besides the necessity of fixing standards, a competent staff of analysts and inspectors is necessary, and for any real success the co-operation of the people is required.

Adulteration of milk.

42. The adulteration of milk is almost universal in Indian bazaars and a large proportion of the milk consumed is contaminated. In most cities, the milk-supply is in the hands of men ignorant of the elements of sanitation and addicted uncleanly practices. Moreover, the milk when stored and in transit to market is liable to contamination in several ways. On the other hand, the price of milk is already very high and the problem of improving the purity of the supply without increasing the price to such an extent as to cause hardship to the poorer classes is a difficult one.

The Lucknow sanitary conference recommended that the development of the dairy industry and the organisation of the transport and sale of milk should ordinarily precede measures of sanitary restriction; and that there should be mutual help and co-operation between sanitarians, milk dealers and the agricultural department. That department is already considering how to develop a profitable dairy animal, a measure largely dependent on suitable and regular feeding. While local authorities should clearly insist on cleanliness in the conditions under which cattle are milked and dairy produce is manufactured, stored or transported in towns, the removal of cattle so far as possible to cheap, healthy and natural surroundings outside cities is a measure greatly to be commended. The establishment of co-operative dairy farms in the United Provinces, the Central Provinces and elsewhere has so far been attended with success and should be encouraged. Attempts might well be made to induce *gwalas* to organise milk production outside cities and its transport to market on co-operative principles. Should these methods prove successful, it may be possible without raising the price to bring the milk-supply under necessary sanitary control. The Government of India commend the whole question to the early attention of local Governments. With regard to milk standards, conditions in India differ from those in Europe, and chemical standards should be fixed by persons possessing adequate local knowledge and experience, and with due regard to local conditions.

Town-planning and relief of congested areas.

43. While much has been done to provide drainage and pure water in large cities, there can be little hope of improving their sanitary condition permanently until measures are taken to relieve congested areas and to provide broader streets and buildings more open to sun and air. The constitution in 1898 of the Improvement Trust in Bombay marked a notable step in advance. By the end of 1912-1913, the Bombay Trust had incurred an expenditure of Rs. 488 lakhs (£3,253,333) towards schemes aggregating Rs. 802 lakhs (£5,346,666). Broad roads have been driven through the heart of the city, slum areas have been abolished; and dwellings provided for the accommodation of the poorer classes. The Calcutta Improvement Trust constituted in 1911 is now developing similar schemes for the improvement and development of Calcutta. Funds for these great projects have been provided mainly from local taxation and municipal contributions, supplemented in the case of each city by an imperial grant of Rs. 50 lakhs (£333,333) and, in the case of Calcutta, by a recurring grant of Rs. 1½ lakhs (£10,000) for 60 years. In other provinces, similar works have been carried out on a smaller scale in the larger towns notably in the United Provinces and at Lucknow.

There has been, as already stated, an increasing desire on the part of the well-to-do in cities to escape from their present insanitary surroundings and to obtain houses in more open positions outside city limits. In India, as in England, municipalities are confronted by the difficulty of obtaining land for town extensions except at prohibitive cost. The multiplicity of small owners in the country, and the impossibility of persuading them to co-operate render any considered and comprehensive plan of town extension impossible in the absence of some controlling and co-ordinating authority armed with powers of compulsion. In their letter of 26th July 1912, the Government of India indicated their opinion that where land on the outskirts of a town was mainly agricultural and could be acquired cheaply *en bloc* the local body would probably be well advised to purchase it outright.

44. Such a policy, however, will, for financial reasons, often be impossible on a large scale. Where the cost of acquisition is prohibitive, control may be preferable to acquisition, and in their circular letter of the 26th July 1912 the Government of India drew attention to the features of a scheme under discussion in the Bombay Presidency which has now been incorporated in a Town Planning Bill. The principal feature of this scheme is that the cost

is apportioned and recovered from the various persons and interests concerned in the shape of a development contribution calculated in proportion to the increased value which is estimated to accrue to each plot on the completion of the scheme, the tax that can be levied from any one owner being limited, as in England, to one-half of the betterment estimated to accrue. The local body remains liable for any excess cost not covered by the tax. Such a scheme involves taking powers to pool and redistribute small holdings in a form suitable for building purposes. It has the advantage of reducing capital outlay while securing for public purposes a share in the profits of the transaction. The Government of India have also invited an examination of the provisions of municipal acts for dealing with insanitary areas and have inquired whether the limitations contained in the English Housing Acts on excessive compensation in areas, which, after due inquiry, have been declared insanitary, might not be introduced in India. The first step towards improvement is to fix a standard of light and ventilation suitable to local conditions; the next is to ensure that adequate building regulations providing for this standard are introduced by all municipal bodies and that a competent executive staff is appointed with full powers to carry them out. The whole question will be reviewed when the replies of local Governments have been received.

Rural sanitation.

45. The difficulties which surround rural sanitation in India are well-known and persistent. Contaminated sites, polluted water-supply, badly constructed and insanitary dwellings, the habits and prejudices of the people raise obstacles to progress which in most provinces are still well-nigh insuperable. The Government of India have informed local Governments that they are at liberty to expend a portion of the imperial grants for urban sanitation on rural sanitation, provided practical schemes for this purpose are forthcoming; but they have postponed special imperial grants for this purpose until such schemes are more generally advanced. They fully appreciate the enormous importance of rural sanitation in a country which is mainly agricultural. Past experience and present conditions, however, indicate that the subject is still one for experiment on lines conceived to attract the co-operation of the people. Without their cordial help no sanitary staff could effectually deal with the village sanitation of the two hundred and twenty millions who inhabit rural areas in British India. The danger of employing low-paid and imperfectly trained subordinates in a matter so closely affecting village-life is now generally recognized and should never be out of mind.

46. The following observations are based on practical experience of rural sanitation:—

(*a*) Travelling dispensaries may be used to spread a knowledge of the simple facts regarding the more common diseases. For this purpose the sub-assistant surgeons in charge should be given a special training in hygiene. Once they become known to the people as healers of the sick their advise as sanitarians may become more acceptable.

(*b*) The improvement of the village water-supply is as important as it is difficult. Apparently, excellent results have been obtained by disinfection of wells with permanganate of potash. Experiments are being made in different parts of India in the use of tube-wells, etc. It might serve as an useful object lesson to use pumps and tube-wells for the provision of water at fairs, schools, hospitals and local public offices. In some localities, a tank supply alone is possible and the difficulty is to protect even new tanks from pollution.

(*c*) In several provinces, notably in Madras, village unions, or circles, have been formed and their committees entrusted with small grants for the improvement of the sanitation of the village site. This measure might be extended experimentally elsewhere. It is calculated to encourage discussion and inquiry regarding sanitary work.

(*d*) Village midwives are, in some districts, encouraged by small grants of money and rewards to attend at the headquarters hospital for a short and simple course of training. These measures open up possibilities with reference to a reduction in infantile mortality and children's diseases generally.

(*e*) In most districts in India, the civil surgeon is also in theory the sanitary officer of the district. His duties at headquarters, however, do not allow him to tour and inspect in the district to the extent that is necessary: even in the case of epidemics in the district it is sometimes not possible for him to leave headquarters. In some provinces, district sanitary officers have been appointed and there can be little doubt that many more such appointments are required and that one of the most urgent and hopeful measures for promoting rural sanitation is the appointment of well-qualified and whole-time district health officers to control and organise all sanitary arrangements and experiments in the district.

Need for education.

47. The diffusion of sound education will, however, remain the most potent and penetrating instrument of sanitation among a population which still views it for the most part with hostility, or unconcern. The claims of hygiene as part of their educational policy were recognized by the Government of India in their educational resolution of the 21st February 1913. It may be hoped that before many years have passed educational institutions will have

become missions of sanitation in their own vicinity and beyond. Meanwhile, some simple knowledge of the more common infectious diseases may with advantage be diffused. The difficulties are considerable and systematic organisation is required. The Indian branch of the St. John Ambulance Association has offered its valuable assistance. In several provinces, pictorial leaflets are distributed and simple lantern lectures and demonstrations are given at fairs and other large gatherings, while in Bombay popular lectures to teachers, students and others have been organised by Major Glen Liston. The Indian Research Fund Association has decided to establish a central bureau where lanterns and lantern slides, pictures, and skeleton lectures can be stocked for issue on loan. Much may be done by utilising the services of municipal health officers and medical subordinates attached to travelling dispensaries and by enlisting the sympathies and active help of medical women, private medical practitioners, and private philanthropic agencies and persons. Sanitation must begin at home and as the Hon'ble Sir Pardey Lukis and Colonel Firth, the former on the civil, the latter on the military side, have pointed out, there will never be any real advance in domestic or personal hygiene until the women of the country realise its advantages and necessity. The encouragement of medical women to preach the gospel of health inside the zenana and to organise purdah parties for simple lantern demonstration lectures and the employment of nurse visitors as in Delhi, Calcutta, Madras and Bombay, are to be commended. Periodical local conferences and publications similar to that recently issued by the Bombay Government entitled " Some recent sanitary developments in the Bombay Presidency " are very useful and keep the question of sanitation before the public mind. Other methods for preparing people to combat preventible disease and premature mortality may suggest themselves. There is room for many workers in the sanitary field. The Governor-General in Council appeals with confidence to all who have interest in the well-being of India to join with him and the local Governments in a sustained endeavour to give effect to His Imperial Majesty's most gracious wish that the homes of his Indian subjects may be brightened and their labour sweetened by the spread of knowledge with all that follows in its train, a higher level of thought, of comfort and of health.

STATISTICS OF BRITISH INDIA, VOL. III, PUBLIC HEALTH

INTRODUCTORY NOTE

The statistical tables in this volume relate to vital occurrences, hospitals, lunatic asylums, vaccination, and deaths from and destruction of wild animals. The statistics refer, with the exception of those relating to vaccination, to the calendar year. Three charts, showing (i) the Indian birth rate and death rate for a series of years, (ii) mortality from "fevers" in each province, and (iii) mortality from principal diseases in British India, have been added as in the previous issue with a full index for easy reference. An attempt has been made in this note to bring out the main conclusions that may be drawn from the summary and general tables.

SUMMARY TABLE

Table 1 gives the salient features of the statistics relating to Public Health.

VITAL STATISTICS

Birth and Death Rates

In India there is no universal *compulsory* registration of births and deaths, as in the United Kingdom and in certain other countries. The registration of births and deaths is now carried out in a population of 238½ millions, or some 98 per cent, of the total population of British India. The reporting of vital occurrences is still defective, and all conclusions from these statistics should be drawn under reserve. Nevertheless these records of vital occurrences are valuable for comparative purposes, especially when one year is compared with its immediate predecessor, and one month of the year with another. These returns also enable one to distinguish generally the comparative birth rates and death rates, province by province, and the general causes of mortality, healthy and unhealthy seasons of the year, and also years of especially low or high mortality. A comprehensive scheme for the general recording of vital statistics has been formulated by the Government of India in a Resolution on Indian Sanitary Policy which is published as an appendix to this volume.* It is sometimes said that a higher level of intelligence and education together with the fear of legal penalties tend to make the registration of births and deaths in towns more accurate than in rural tracts; a study of the Annual Sanitary Reports for the various provinces, however, does not entirely support this view. Instances are recorded of mun icipalities in which the percentage of unreported births and deaths has ranged according to one expert, as high as from 35 to 75 per cent. Wherever independent investigation has been undertaken a large proportion of omissions has been discovered. In rural areas it is generally recognized that registration is very often incomplete and unsatisfactory. Dr. Bentley, Sanitary Commissioner, Bengal, observed in a paper on Vital Statistics (submitted to the All-India Sanitary Conference in 1914) that in rural areas in Bengal where the recording of vital occurrences is one of the duties of the village chowkidars or watchmen, the error in registration appeared to be largely due to unequal distribution of the chowkidars in different districts, and that districts which possessed a high proportion of chowkidars invariably showed a relatively high mortality, and districts with a low proportion of chowkidars recorded a low mortality. This may, indeed, apply to other provinces besides the Presidency of Bengal. It shows that the registration of births and deaths is defective, and a caveat to this effect is necessary in any complete examination of returns. The Actuary in the Census of 1911 points out:—"The registers of births and deaths, although showing great and progressive improvement as compared with previous years, are still very incomplete, and probably contain many inaccuracies."

The Census report also states:—"In most provinces the vital statistics are still very defective. They are based on returns from village headmen or watchmen; and although they are tested to a certain extent, this checking is not complete and thorough."

It appears, from an investigation made in India of the variation of the population during the ten years 1901-1910, by comparison of the relative numbers of registered births and deaths with the movement in population as shown by the Censuses of 1901 and 1911, that the movement, as shown by these two methods, varies quite materially in each Province. For instance, in the Province of Bombay, the statistics of births and deaths show a reduction in the total population of 217,469, while the Census Returns for the same province show an increase of 1,110,801 persons, the difference between these figures being 1,328,270. The inflow of immigrants, it may be noted, during the decennium in the Province of Bombay will account only for a small portion of this difference. Again, in the United Provinces of Agra and Oudh, the excess of births over deaths during the decennium amounts to 1,017,726, whilst the population statistics show a diminution in the population of 510,233, a difference of 1,527,959, and here, again, the outflow of emigrants during the decennium will not account for this large discrepancy.

Note.—The previous issue of this volume was published under the title of Statistical Abstract for British India, Vol. III,

* *Vide* pages 115—127.

The Indian Birth Rate

The total number of births in British India fell from 9,447,300 in 1914 to 9,021,825 in 1915. This represents a birth rate of 37·82 per thousand of population. The Central Provinces record the highest birth rate, 47·95 per mille, followed by the Punjab 43·6, the United Provinces 43·48, and Bihar and Orissa 40·4. All the other major provinces had a birth rate below 40 but over 30 per mille. Bengal with a birth rate of 31·8 per mille and Madras with 31·2 per mille record the lowest rates. The following is the birth rate per province :—

Ratio of Births in each 1,000 of population by Provinces

Province	1914	1915	Variation ± (Number of births for 1914 = 100)
Central Provinces and Berar	51·4	47·9	—7
Punjab	46·3	43·6	—6
United Provinces	44·9	43·5	—3
Bihar and Orissa	42·3	40.4	—4
Delhi	48·9	47·9	+3
Ajmer-Merwara	46·9	43·8	—7
Bombay	37·4	37·1	—1
Burma	35·4	35·1	—1
Assam	32·9	33·6	+2
Bengal	33·9	31·8	—6
North-West Frontier Province	32·7	31·7	—3
Madras	33·5	31·2	—7
Coorg	26·2	25·3	—3

This birth rate is considerably higher than in most European countries. According to the report of the Registrar-General of Births, Deaths, and Marriages in England and Wales (1915), the total births, in proportion to the total population of both sexes and all ages, were equal to a rate of 22·0 per 1,000 living. In the year 1876, it may be noted, that the birth rate in England and Wales attained the highest point on record, *viz.*, 36·3 per 1,000 living, since which date the ratio has, with a few insignificant exceptions, fallen year by year. The birth rate in Scotland according to the report of the Registrar-General for Scotland (1915) was 23·86 per thousand of population. In Ireland the birth rate according to the Registrar-General's report for Ireland (1915) was 22·0 per 1,000 of population. It will be seen that these birth rates are very considerably lower than the Indian birth rates.

No decline in the Indian Birth rate

It is interesting to note that the Indian birth rate does not share in the general decline which is noticeable in most European countries. The birth rate in India has risen from 35·6 per 1,000 of population in the quinquennial period 1886-90 to 37·8 in 1915. From the latest available international birth rate statistics it appears that the German Empire, which recorded a birth rate of 36·5 per 1,000 persons living in the quinquennial period 1886-90 had a birth rate of 28·3 in 1912. The rate in France has declined from 23·1 in the same quinquennial period to 19 in 1913. In Italy it has declined from 37·5 in 1886-90 to 32·4 in 1912. In Denmark from 31·4, in Norway from 30·8, and in Sweden from 28·8 in 1886-90 to 25·6, 25·2 and 23·1 in 1913, respectively. While Roumania records a rise from 40·9 in the same quinquennial period to 42·1 in 1913. In connection with the steady increase in the Indian birth rate allowance should be made for the incompleteness of the earlier records. It would perhaps not be wrong to anticipate higher birth rates and also even higher death rates with the increased attention that is now paid to registration.

It will be seen from table 3 that there is very great variation between the maximum and minimum for districts, in Bengal, for example, the maximum in any district in 1915 was 43·06 per thousand of population, the minimum was 18·5. For Madras it was 37·6 and 21·9, for Bombay 50·78 and 17·54, for the United Provinces 49·25 and 25·44, for Bihar and Orissa 48·1 and 31·7, for the Punjab 51·3 and 21·3, for Delhi 49·63 and 33·75, for Burma 44·7 and 19·74, for Central Provinces and Berar 53·19 and 42·97, for Assam 39·71 and 30·17, for North-West Frontier Province 38·3 and 26·6, respectively.

Excess of Male Births

A characteristic of the Indian birth rate and population is the higher birth rate of males and the excess of males over females in the total population. The percentage of male to female births ranged from 125·5 in the North-West Frontier Province to 104·5 in Madras and 101·59 in Coorg. Generally speaking, it will be seen that the proportion of female births is lowest in the North-West of India, and that it greatly increases towards the South-East, being highest in Madras, the Central Provinces and Berar, Bihar and Orissa, and Burma. It is also interesting to contrast the proportion for the whole of India with that obtained in Western Europe where the number of females per thousand males varies from 1,093 in Portugal and 1,068 in England and Wales to 1,013 in Belgium and 1,003 in Ireland, the general average being 1,038. The figure (1,038) is taken from J. Athelstane Baines's paper on *The Recent Growth of Population in Western Europe.* (*Journal of the Royal Statistical Society*, LXXII, p. 685). At the same time it should be noted that with regard to the proportions in India and Western Europe that Western Europe is the only part of the world where females are in excess. In the South-East of Europe they are in marked defect; and in some of the Balkan States the deficiency is almost as great as it is in India. The same state of things exists in all eastern countries where censuses have been taken, as well as in the United States,

Canada, New Zealand, and several of the Australian Colonies. It may be said that in respect of the sex proportions the figures for Western Europe may be taken as exceptional, and that those in India do not differ greatly from the proportions in other parts of the world. In the table below the following countries of the British Empire are arranged in the serial order of the proportion of females to males among their inhabitants* :—

Country	Females to 1,000 males	Country	Females to 1,000 males
North Nigeria	1,698	Gambia Protectorate	980
Barbados	1,449	South Africa (Black)	970
Leeward Isles	1,307	Cyprus	967
Nyassaland	1,259	India	953
Bahamas	1,244	Newfoundland	952
Swaziland	1,231	British Guiana	926
Windward Isles	1,213	Australia	926
Uganda	1,211	Trinidad	912
Basutoland	1,197	Mauritius	903
Gibraltar (Civil)	1,176	South Rhodesia	899
South Nigeria	1,166	New Zealand	896

Gold Coast Protectorate	988	Malay States	429
British Honduras	986	Falkland Isles	382

It will be seen from table 3 that in the provinces in India the table below exhibits the order of proportion of males to every 100 females amongst their inhabitants in 1915, and this is of exceptional interest in regard to the study of birth rates and the relations of the relative proportion of the sexes :—

North-West Frontier Province	125·5
Ajmer-Merwara	113·53
Punjab	109·7
United Provinces	108·76
Bombay	107·74
Bengal	107
Assam	106
Bihar and Orissa	105
Delhi	105
Burma	105
Central Provinces and Berar	104·59
Madras	104·5
Coorg	101·59

It may be noted that there is sometimes a considerable difference between the reported occurrences of births and those calculated by the Actuary at the 1911 Census. It will be seen from the marginal statement that while in the Punjab, the estimated and reported birth rates closely agree, the difference in other provinces is large. The vital statistics, as already pointed out, are based on returns from village headmen or chowkidars, and although they are tested to a certain extent this checking is in no way so complete and thorough as is the checking of the census schedules by supervisors and charge superintendents.

Province	Rate per mille of births: Reported	Estimated by Actuary
Assam and Bengal	38·9	46·7
Bombay	33·4	41·0
Burma	33·9	42·9
Madras	30·8	41·9
Punjab	41·2	44·3
United Provinces	41·4	46·5

The Indian Death Rate

The total number of deaths in British India fell from 7,155,771 in 1914 to 7,142,412 in 1915 or from 30 to 29·94 per thousand of population. The continued fall of the death rate from 33·2 in 1910 to 28·72 in 1913, which was the lowest on record since 1898, showed a tendency to rise in the two succeeding years. The death rate in five out of the ten major provinces of British India was lower than in 1914. Bengal, Bihar and Orissa, the Punjab, Burma, and Assam, reported enhanced rates as compared with the preceding year. In Bengal the increase was not very considerable. The Punjab, however, reported a death rate of 36·33 per mille, as compared with 31·96 in 1914. The increased mortality rate was entirely accounted for by the severity of the plague epidemic without which 1915 would have been an extremely healthy year. Cholera and small pox are largely responsible for the high rate from 28·3 per mille in 1914 to 32·2 in Bihar and Orissa. In Assam all the chief causes of mortality were responsible for higher death rates than normal, representing 30·86 as against 24·66 in 1914. The death rate in Burma also increased from 24·13 to 27·99, cholera being responsible for 17,597 deaths or 1·79 per mille as against 2,073 or ·21 per mille in 1914. The fall in the death rate in the Madras Presidency from 25 per mille in 1914 to 22 in 1915, which is very appreciably lower than the rate reported from any other administration, gives proof of the absence of any severe epidemics. The fall in the death rates in the United Provinces from 33·46 to 30·04, Bombay from 29·48 to 26·12, and the North-West Frontier Province from 25·8 in 1914 to 23·6 in 1915 is noticeable. In the Central Provinces, however, the fall in the death rate from 36·69 in 1914 to 35·91 in 1915 is small.

Cf. Sir J. A. Baines's paper on *The Census of the Empire*, 1911, (*Journal of the Royal Statistical Society*, Vol. LXXVII, March 1914, page 391.)

In table 4 the number, and ratio to population, of deaths is shown for a period of ten years. The variation between the maximum and minimum for any one district is of exceptional interest. In 1915 the variation in Bengal was 45·21 and 22·77; Madras 36·4 and 15·5; Bombay 39·16 and 13·66; the United Provinces 52·97 and 19·05; Bihar and Orissa 44·2 and 21; the Punjab 57·4 and 19; Delhi 34·16 and 22·81; Burma 51·41 and 18·27; the Central Provinces and Berar 44·51 and 25·97; Assam 40·91 and 25·41; and the North-West Frontier Province 29·8 and 19·2. The following is the death rate per province :—

Ratio of Deaths in each 1,000 of population by Provinces

Province	1914	1915	Variation ± (Number of deaths for 1914-100)
Punjab	32·0	36·3	+14
Central Provinces and Berar	36·7	35·9	— 2
Bengal	31·6	32·8	+ 4
Bihar and Orissa	28·3	32·2	+14
Coorg	34·0	31·1	— 9
Assam	24·7	30·9	+25
United Provinces	33·5	30·0	—10
Delhi	38·0	29·0	—20
Burma	24·1	28·0	+16
Bombay	29·5	26·1	—11
Ajmer-Merwara	30·3	26·0	—14
North-West Frontier Province	25·8	23·6	— 8
Madras	25·0	22·0	—12

It is interesting to compare the Indian death rate with the death rate in the United Kingdom. According to the Registrar-General's report for England and Wales for 1915, the death rate corresponds to a rate of 15·7 per thousand of population, which is 1·7 higher than that of the preceding year, and is ·3 higher than the average rate in the ten years 1901-10. The death rate of Scotland according to the Registrar-General's report for 1915 was 17·06. Although 1·23 more than the mean of those of the preceding ten years, it is less than those of all years from 1855 to 1895. The death rate of Ireland in 1915 amounted to 17·6 per thousand of population.

The death rates in other European countries* in 1913 were as follows :—
Hungary, 23·3; Roumania, 25·9; Spain, 22·1; Servia, 21·1; Austria, 20·5; Italy, 18·2; France, 17·7; Finland, 16·3; Prussia, 15·5; Sweden, 13·6; Norway, 13·2; Denmark, 12·5 and Holland, 12·3.
The chart in the *frontispiece* illustrates the fact that the male death rate is higher than the female death rate.

Infantile Mortality

An analysis of tables 7 and 8 will show the remarkable mortality of children under one year ; the figures are as follows :—

Ratio of deaths in each thousand of population *under one year* of age

Province	1914		1915		1914	1915
	Male	Female	Male	Female	Both sexes	
Bengal	227·28	215·22	224·43	213·13	221·47	218·99
Madras	206·35	186·27	194·4	178·4	196·51	186·57
Bombay	201·86	185·15	178·92	164·55	193·8	172
United Provinces of Agra and Oudh	238·15	228·39	209·85	200·03	233·47	205·14
Bihar and Orissa	177·71	164·43	190·76	180·86	171·22	185·94
Burma	229·53	202·35	235·79	202·05	216·36	219·35
Central Provinces and Berar	281·89	245·11	274·28	244·49	263·89	259·72
Assam	200·32	177·84	210·78	192·41	189·49	201·9
Average	220·02	203·5	210·42	196·06	212·02	203·47

Infantile mortality rates vary considerably, province by province, and the average number of deaths below one year is 220·02 for males and 203·5 for females in 1914 and 210·18 for males and 196·06 for females in 1915. During the year 1915 among the major provinces infantile mortality was highest in the Central Provinces, Burma, and Bengal, but it showed a decrease in Bengal, Madras, Bombay, the United Provinces, and the Central Provinces, as compared with the previous year. This high infantile death rate is due, according to the reports of local authorities, to the weakness of the children of immature or ignorant parents, faulty midwifery, general insanitary condition of villages and dwellings therein, and to the prevalence of malaria. To some extent, however, the rate is apparent since it is calculated on imperfect returns of births.

* The death rates of Hungary, Servia, Austria, Italy, Finland, and Prussia are for 1912 as figures for 1913 are not available.

It is of interest in this connexion to compare the Infant Mortality rates in England and Wales. Infant Mortality (Deaths under one year per 1,000 births), 1914 :—

	Males	Females	Both sexes
London	114	94	104
County Boroughs	134	107	121
Other Urban districts	110	88	99
Rural Districts	96	75	85
All areas	116	93	105

In the Registrar-General's report for Scotland, 1915, the infantile mortality rate of the year amounted to 126·5 per thousand births. It is 14·9 more than the mean of those of the preceding ten years, and is the highest since 1901.

Excess of births over deaths

In the whole of British India the birth rate exceeded the death rate by 7·88 per mille during the year 1915. The birth rate exceeded the death rate in every province except Bengal and Coorg, the increase was most marked in Delhi (where the birth rate exceeded the death rate by 18·95 per mille), the excess of births over deaths was least marked in Assam where the difference was only 2·74 per mille.

There was, however, an excess of deaths over births in the cities of Calcutta, Bombay, Madras, and Rangoon : the figuresin 1915 are as follows :—

	Births	– Deaths	Excess of deaths over births
Calcutta	16,578	25,590	9,012
Bombay	20,052	23,681	3,629
Madras	18,331	18,688	357
Rangoon	5,791	8,515	2,724

The total number of births registered in Calcutta fell from 17,386 in 1914 to 16,578 in 1915, representing a birth rate of 19·4 and 18·5 per thousand of population, respectively. On the other hand, the number of deaths rose from 25,431 in 1914 to 25,590 in 1915 with a death rate of 28·3 and 28·5 per thousand, respectively. The severe epidemic of small-pox which caused 2,560 deaths or 2·9 per thousand was solely responsible for the increased mortality. The death rate in Calcutta in 1915 amongst females was 37·8 per thousand as compared with 24·1 amongst males, which is the inversion of the normal ratio between male and female deaths in India generally. The inversion of the normal ratio between male and female deaths is a striking feature of the vital statistics of Calcutta. This high mortality amongst females is attributed largely to the observance of the purdah system in insanitary environments. It may also be due to the extraordinary fluctuations which take place in the male population which is, as compared with the female population, not nearly so fixed.

Causes of Death

There are three main classes of fatal disease : specific fevers, diseases affecting the abdominal organs, and the lungs. The specification of the causes of mortality is limited to cholera, small-pox, plague, fevers, dysentery and diarrhœa, respiratory diseases, and injuries. Among the principal causes of deaths, "fevers" always exact the heaviest toll. The heading "fevers" is frequently misleading. Although "fevers" in India are generally understood to mean malarial fever, many causes of death and many diseases much more fatal than malarial are included under the heading. In rural districts every known febrile condition and many non-febrile causes of death are put under this head. One authority has, for example, stated that in parts of Bengal 10 per cent. of the so-called "fever" deaths are due to tuberculosis, and malaria usually accounts for 25 to 33 per cent of deaths so returned. In 1915 there were 3,990,287 deaths, being 56 per cent of the total mortality.

The recorded mortality from cholera, small-pox, and plague during the last five years is shown in the margin.

	Cholera.	Small-pox.	Plague.
1911	354,005	58,535	733,582
1912	407,769	89,357	263,037
1913	294,815	98,155	198,456
1914	280,730	76,590	266,474
1915	404,472	83,282	380,501

In this period 1,741,791 persons are reported to have died of cholera, the annual average mortality being 348,358. The deaths from small-pox were one-fourth of the deaths from cholera, amounting in the same period to 405,919, the annual average being 81,184. Deaths from plague amounted to 1,842,050, the annual average being 368,410. There were marked decreases in the mortality from cholera during the years 1913 and 1914, but the number of deaths rose to 404,472 in 1915. The mortality from small-pox increased from 76,590 in 1914 to 83,282 in 1915, the larger increase being in the provinces of Bengal, Bihar and Orissa and Assam. Bengal recorded 32,785 deaths in 1915, the highest figure in the quinquennium.

The number of deaths from Plague, which reached the highest point in 1907 since its first outbreak in 1896 fell from 1,166,223 to 113,888 in 1908, but it increased to 733,582 in 1911, falling again to 198,456 in 1913, and rose to 380,501 or 5 per cent of the total mortality in 1915. In the twenty years during which plague has prevailed in India the total recorded deaths have been about seven and a half millions. Bombay

which has lost 1,595,908 between 1896 and 1915, suffered most in the year 1903, and there has been a considerable diminution of the disease since that date; there was, however, a recrudescence in 1911, the mortality being one of 100,399; the number again fell to 28,984 in 1912 and it came up to 43,824 in 1915. The year 1907 was a disastrous one for the Punjab, the number of deaths recorded during that year having aggregated 608,685 against 91,712 in 1906. After a period of two years during which the incidence of plague was comparatively light, the province was again visited with an epidemic of considerable severity in 1910 and there was an equally severe visitation in 1911, the mortality in these two years being 135,483 and 175,345, respectively. During the year 1915 the number of deaths rose to 221,966. The United Provinces which suffered almost as severely as the Punjab from the same disease in 1907 had a better year in 1908; the mortality then rose steadily to 332,301 in 1911, but in 1915, 58,128 deaths were returned. In Madras plague was responsible for 2,872 deaths in 1907 against 898 in the preceding year; in 1911 the number rose to 15,185, falling again to 3,889 in 1915. The mortality in Burma showed a slight increase from 6,946 in 1909 to 7,741 in 1910 which was ascribed to more accurate reporting of deaths. A decrease was noticeable in 1911, and this was maintained during the year 1913 though the number was little higher than that of 1912. There was, however, a rise in 1914, but the mortality again fell to 4,640 in 1915. It is stated that this decrease in plague mortality was recorded in districts and towns where an active and up-to-date anti-plague policy had been in force for some years. The number of deaths from plague is declining as will be seen in the marginal table.

Year.	Number of deaths from Plague.
1906.	300,355
1907.	1,166,223
1908.	113,888
1909.	145,333
1910.	413,355
1911.	733,582
1912.	263,037
1913.	198,456
1914.	266,474
1915.	380,501

In the face of great practical obstacles, three principal measures for combating plague are now adopted:—

(1) The temporary evacuation of quarters in which plague is prevalent. This has proved to be the most effective way of removing man from contact with infected rat-fleas. Government is ready to supply money and material to provide temporary dwellings and to alleviate the discomfort and distress which must accompany evacuation of quarters, a matter of course, in which no pressure can be exerted, and in regard to which the wishes and even the prejudices of the people must be consulted.

(2) Inoculation with the prophylactic fluid. The efficacy of this remedy on the occasion of an outbreak has been placed beyond doubt; it is freely resorted to, and encounters little popular prejudice, when the presence of plague is felt; but as a general or permanent remedy it is obviously of limited utility.

(3) The systematic destruction of rats (for which purpose smoking has been found an admirable method, as it kills the fleas as well as the rat), the diminution of the food supply to which they have access, and, in the course of time, such improvement in the structure of houses and grain-stores as shall render them reasonably rat-proof.

Deaths according to classes of population

With regard to mortality among the different classes of the population in British India it may be noted that the ratios of deaths per thousand of population showed some improvement in the year 1915 under the classes Hindus and Christians, the ratios being 29·08, and 19·33 against 30·05, and 19·99 respectively in the previous year. Muhammadans and Buddhists, on the other hand, registered an enhanced death rate, namely, 32·04 and 28·58 per thousand against 30·22 and 24·36, respectively, in the previous year.

Deaths in each month of the year

In Bengal December was the most unhealthy and July the healthiest month in the year 1915. In Madras the healthy months were April, May and June, while January was the most unhealthy. The death rate in the province of Bombay was the highest in December and lowest in June. In the United Provinces October and December were the most unhealthy months and February the healthiest. In Bihar and Orissa November was the month of maximum mortality and February that of least. As regards the Punjab, September was the healthiest month and April, May and March the unhealthiest months. In Delhi the highest number of deaths occurred in December and the lowest in February. The month of May was the healthiest and the month of September the unhealthiest in Burma. In the Central Provinces October was the month of greatest mortality and July the month with the fewest deaths. In Assam November was the most unhealthy month and February the healthiest month. In the case of the North-West Frontier Province, December was the month of maximum mortality and April that of least. December was the most unhealthy month and July the healthiest in Ajmer-Merwara. In Coorg the middle four months of the year were the most unhealthy.

On the average of the last five years, February, June and July have been the healthiest months and November and December the unhealthiest. The greatest mortality occurred in December, while the lowest was in February.

HOSPITALS

Hospitals and dispensaries in British India are divided into six classes.

Class I—State Public; Class II—State Special,—(1) Police, (2) Forests and Surveys, (3) Canals, (4) Others—The first two classes include all institutions maintained from Provincial Funds and under Government management. The fact that an institution possesses endowments or receives contributions from local funds or private subscriptions is not regarded as a reason for not classing it as "State" so long as Provincial or Imperial funds are practically responsible for all the charges connected with it. Hospitals and dispensaries of the first class are open to all comers, while those coming under the second head serve only that special section of the public indicated in the sub-classification.

Class III—Local Funds.—This class includes all institutions, the management of which is vested in local boards or municipalities or which are guaranteed or maintained by local or municipal funds. The fact that such an institution is aided by private subscriptions, or receives assistance from Government in the shape of part of the salary of the medical officer, grants of medicine, or otherwise, is not regarded as a reason for not classing it as a local fund dispensary, so long as its existence is practically dependent upon local funds.

Class IV—Private aided.—This class includes institutions almost entirely supported by private subscriptions or guarantee, but receiving some aid from Government or local funds.

Class V—Private non-aided.—This class is comprised of institutions maintained entirely at the cost of private individuals or associations. The fact that Government provides a superior inspecting agency is not regarded as a reason for not treating an institution of this kind as "Private non-aided."

Class VI—Railway.—This class comprises all railway dispensaries whether maintained by State railways or others.

These various classes of hospitals and dispensaries are divided into three groups for the purposes of the tables in this volume. The first group comprises State-Public (Class I), Local Fund (Class III), and Private aided (Class IV) institutions, the second group State-Special (Class II) and Railway (Class VI) hospitals and dispensaries, and the third group represents Private non-aided (Class V) institutions.

The following table summarises the progress of these institutions during the years 1880 to 1915.

State-public, Local Fund and Private aided institutions—

	1880.	1890.	1900.	1910.	1911.	1912.	1913.	1914.	1915.
Institutions	1,212	1,736	2,313	2,685	2,722	2,750	2,814	2,856	2,995
Patients (in thousands)—									
Indoor	217	255	377	457	464	497	519	536	542
Outdoor	7,192	12,722	20,110	28,030	27,732	29,130	30,163	31,387	33,032
TOTAL	7,409	12,977	20,487	28,487	28,196	29,627	30,682	31,923	33,574
Surgical operations performed (in thousands)	372	604	815	1,035	1,146	1,209	1,243	1,292	1,356
	R	R	R	R	R	R	R	R	R
Income (in thousands)—									
From Government	19,03	20,73	27,76	43,03	46,53	49,25	55,30	61,96	63,10
From Municipal and Local Funds	12,90	22,07	31,64	56,98	57,85	64,19	63,53	72,52	75,60
From subscriptions, endowments, fees, and other sources	5,02	5,69	13,36	19,52	26,05	25,16	23,94	24,71	26,44
TOTAL	36,95	48,49	72,76	1,19,53	1,30,43	1,38,60	1,42.77	1,59,19	1,65,14

Other hospitals and dispensaries in 1915.

	Institutions.	Patients. (In thousands)
State-Special and Railway hospitals and dispensaries	856	2,731
Private non-aided institutions	714	5,064
TOTAL	1,570	7,795

From the above table it will be seen that the total number of institutions in the first group, *i.e.*, those described as General hospitals and dispensaries in the year 1880 was 1,212, in 1890, 1,736, in 1900, 2,313, in 1910, 2,685, and in 1915, 2,995; or in other words in 36 years the number of hospitals has more than doubled. Taking the figure of 1900 as equal to 100 the figures for 1910 and 1915 were 116 and 129, respectively.

There were three main causes for the slow progress in early years—indifference on the part of the people, want of officers, and insufficient funds. During this period of thirty-six years the number of indoor patients increased from 217,000 in 1880 to 542,000 in 1915. But by far the greater increase is recorded among outdoor patients, the number having risen from 7,192,000 to 33,032,000 during this period. The percentage of outdoor patients to the total population of the localities in which these institutions are situated has risen from 8·2 in 1900, to 11·5 in 1910, and 13·5 in 1915.

From these statistics it will be seen that surgery has grown to be a specially important part of hospital work, and the popular prejudice which at one time existed against it has been largely overcome. The number of cases of operations was only 372,000 in 1880 and 1,356,000 in 1915. The income of these institutions has kept pace with the growth in the number of patients treated, and the receipts from all sources have risen from nearly 37,00,000 to over 1,65,00,000 lakhs within these 36 years.

The number of patients treated in the first group was 33,573,601 of which 541,549 were indoor and 33,032,052 outdoor patients. In the second group the total number treated was 2,730,986 of which 106,045 and 2,624,941 were indoor and outdoor patients, respectively. In the third group there were 69,099 indoor and 4,994,848 outdoor patients treated, making a total of 5,063,947 patients. The total number of patients treated in these groups in 1915 was 41,368,534.

	Indoor.	Outdoor.	Total.
Bengal	94,020	6,343,237	6,437,257
Madras	114,062	7,622,332	7,736,394
Bombay	93,328	4,736,356	4,829,684
United Provinces	101,017	5,699,665	5,800,682
Bihar and Orissa	50,619	3,341,524	3,392,143
Punjab	101,331	5,339,794	5,441,125
Delhi	7,023	312,667	319,690
Burma	84,500	1,947,333	2,031,833
Central Provinces and Berar	21,091	2,122,009	2,143,100
Assam	13,389	1,605,905	1,619,294
North-West Frontier Province	24,519	1,109,857	1,134,376
Ajmer-Merwara	1,250	73,015	74,265
Baluchistan	7,395	294,226	301,621
Coorg	3,149	103,921	107,070
TOTAL	716,693	40,651,841	41,368,534
Percentage to Total	1·7	98·3	100

The number of indoor and outdoor patients treated in each province during 1915 is stated in the margin. Madras shows the largest number of indoor patients followed by the Punjab, the United Provinces, and Bengal. In the three cities of Calcutta, Bombay, and Madras 73,455 indoor patients were treated or 10·2 per cent. of the whole. 56,050 indoor patients were treated in hospitals for females, of whom 16,858 were treated in the 53 institutions of the United Provinces and 12,815 in the 25 hospitals of Madras, aggregating 29,673 patients or 53 per cent. of the total. In regard to outdoor treatment also Madras is ahead of any other province with over seven million patients, out of a total of over forty millions. Of the total number (1,214,362) of outdoor patients in hospitals for women, 388,182 (32 per cent.) were treated in the United Provinces, and 264,124 (22 per cent.) in Madras.

The total number of beds available in 1915 was 50,096 divided in each group as follows. In the State-Public, Local Fund, and Private aided hospitals and dispensaries the number was 24,544 for men and 13,363 for women. In the State-special and Railway institutions there were 6,946 and 295, respectively, and in the private non-aided institutions 2,509 and 2,439, respectively.

In 1915 there were 152 hospitals and dispensaries in group (1) containing 3,211 beds for women only, and there were in addition 10,152 beds available for women in other hospitals in this group. There were also 295 and 2,439 beds for women in hospitals in group (2) and (3), respectively. The total number of beds for females in British India was 16,097. In Bengal there were only seven hospitals for females and the number treated was 2,422.

	Number	Ratio per 1,000
Europeans and Eurasians—		
Males	118,196	91
Females	96,951	81·5
Hindus—		
Males	13,510,247	159·9
Females	5,570,992	68·5
Muhammadans—		
Males	7,723,651	258·7
Females	3,272,368	118·5
Buddhists—		
Males	604,885	115·3
Females	366,837	68

The marginal table shows the number of indoor and outdoor patients, according to class and sex, belonging to the principal religions treated in the hospitals in the first group during 1915 and the ratio per 1,000 of the population, males and females, of each class in British India. It is also interesting to note from the statistics below that Muhammadans as a class resort more freely to hospitals and dispensaries than Hindus.

The statement below shows the number of indoor and outdoor patients treated in the State-Public, Local Fund, and Private aided dispensaries and the ratio to each thousand of population, according to sex and religion in each province during 1915.

Province.		Europeans and Eurasians.	Ratio per 1000 of pop.	Hindus.	Ratio per 1000 of pop.	Muhammadans.	Ratio per 1000 of pop.	Buddhists.	Ratio per 1000 of pop.

(a) Separate population figures for the Delhi Province are not available in the Census table for 1911. The letter 'm' represents male and 'f' female.

The statistics of the principal diseases treated in all the hospitals and dispensaries in British India and the operations performed during the year 1915 are shown in the margin. Malarial fever is the malady most frequently treated in hospitals accounting for 18 per cent. of the total number of cases (34,243,938). Other diseases are shown in the order of the number of cases treated. Small-pox and cholera do not find a place in this list as the number of cases treated are comparatively very small. The number of the former during the year being only 5,889 and of the latter 48,143. During the year under review there were over a million and a half surgical operations performed in these institutions in British India.

	Number of cases.
Malarial fevers	6,116,028
Other diseases of the digestive system	4,837,401
Other diseases of the skin	4,683,122
Diseases of the eye	3,736,889
Ulcers	2,787,693
Diseases of the respiratory system other than tubercle of lungs	2,445,336
Diseases of the ear	2,102,119
Dyspepsia	1,454,407
Operations	1,579,744

The income of the State-Public, Local Fund, and Private aided hospitals and dispensaries in British India in the year 1915 was ₹1,65,13,551 as compared with ₹1,59,18,984 in the previous year. About 84 per cent. of this sum was derived from Government contributions (₹63,10,296), from Local Funds (₹45,77,847), and from Municipal Funds (₹29,81,974). The remainder was mainly derived from interest on investments (₹2,68,931) and from subscriptions (₹10,88,533). Of this latter amount the sum of ₹2,93,119 was contributed by Europeans and ₹7,95,414 by Indians. In the last five years the receipts from Imperial or Provincial Funds, Local Funds, and Municipal Funds have increased by 35·6, 31·9, and 28·8 per cent., respectively.

The expenditure in 1915 amounted to ₹1,66,14,609, including about three lakhs invested. Of this amount a sum of ₹67,49,346 (41 per cent.) was paid as salaries and wages. Drugs and medicines cost ₹24,02,649 (14 per cent.), diet cost ₹15,77,801 (9 per cent.) and construction and repairs to buildings accounted for ₹31,63,443 (19 per cent.).

LUNATIC ASYLUMS

During the five years ending with 1915 the average asylum population was only 8,317. The number admitted into asylums in the year 1915 was 2,339, including 114 re-admissions. The year opened with 6,639 patients already in the asylums making the total population of these institutions 8,978. The average daily population was 6,852, of whom 5,429 were males and 1,423 females. The marginal table shows the distribution of the lunatics that were admitted into asylums in each province for the years 1914 and 1915, together with the ratio per 10,000 of the population. It will be seen that Bombay heads the list with 499 admissions in 1915 against 486 in the previous year. The United Provinces come next with 431 in 1915 against 396 in 1914. The ratio of lunatics who seek admission into the asylums is also greatest in Bombay being ·25 per 10,000 of the population in 1915; but very low in the United Provinces where the ratio is only ·09. In Burma the ratio is ·21, in Assam ·19, in the Punjab ·16, and in Central Provinces ·1. The ratios are lowest in Bihar and Orissa (·03), in Bengal (·05), and in Madras (·06).

	Number admitted and re-admitted in		Ratio per 10,000 of population in	
	1914.	1915.	1914.	1915.
Bombay	486	499	·25	·25
Burma	154	251	·13	·21
Assam	100	129	·15	·19
Punjab	264	311	·13	·16
Central Provinces and Berar	120	137	·09	·10
United Provinces	396	431	·08	·09
Madras	270	268	·07	·06
Bengal	197	214	·04	·05
Bihar and Orissa	96	99	·03	·03

In the Indian Census of 1911 only 67,739 persons were returned as insane in a population of 244,194,918 in British India. Considering the relative positions of insanity and inmates in Asylums in British India there can be little doubt that only a very small percentage of weak minded persons seek admission into asylums. The cases admitted represent therefore, only an eighth of the insane population and the ratio per 100,000 of the population is infinitesimal. It is interesting therefore, to contrast these statistics with a few figures from other countries.

In the 68th Report of the Commissioners in Lunacy (1914) it is reported that the number of insane persons under care in England and Wales was 140,237, or nearly 390 per 100,000 of the population. In the 56th Report of the General Board of Commissioners in Lunacy for Scotland (1914) there were 19,346 insane persons of whom the Board of Commissioners had official cognizance or just over 400 per 100,000 of the population. In the 63rd Report of the Inspectors of Lunatics for Ireland (1914) there were 25,009 insanes under care or in the proportion of 570 per 100,000 of the population. In the United States the figures are (in 1910) 187,791 lunatics or 204 per 100,000 of the population.

Of the lunatics in the Indian Lunatic Asylums during the year 1915, 861 were discharged as cured, 308 were made over to friends, the majority having improved in condition, and 635 died during the year under report. Among the lunatics admitted in 1915 there were 180 Christians of whom 89 were Europeans and Anglo-Indians, 1,321 Hindus, 521 Muhammadans, and 218 of other religions. The number of Christians greatly exceeds the ratio of Christians to the total population. The explanation of this is to be found in the fact that the insane persons amongst Christians seek admission into Asylums more freely, the reverse being the case with lunatics of other denominations in India.

Of the total admissions 2,339 of all classes of lunatics during the year 1915, 507 were reported as criminals, the average of this class admitted in the last five years being 452 or nearly 21 per cent. of the total.

	1914.	1915.
Cultivators and labourers	529	623
Domestic servants	140	170
Traders and Shopkeepers	141	166
Soldiers	25	58
Teachers, Students, and Writers	149	149
Mendicants and paupers	191	135
Artisans	116	113

The previous occupations (as far as is known) of the lunatics who were admitted during the last two years under report are described in the margin. The only noticeable increase occurs under the heading of "cultivators, and labourers" whose number rose from 529 in 1914 to 623 in 1915.

The prevailing forms of insanity in the asylum population in 1915 were stated to have been mania (3,262), melancholia (1,372), dementia (1,270), epileptic insanity (512), and idiocy (463). Regarding the ætiological factors in the patients admitted in 1915, 171 cases were attributed to heredity; mental instability and stress accounted for 543 cases, while 610 cases were reported as toxic.

The expenditure on the asylums, which averaged R14·13 lakhs during the five years ending 1914, amounted to R14,03,633 in the year 1915. Of this expenditure R11,76,316 were borne by the State, R1,27,675 obtained from fees, and R99,642 from other sources.

VACCINATION

In 1880 an Act was passed for the compulsory vaccination of children only in municipalities and cantonments. The Act is now compulsory in all the municipalities and also in 195 villages in the Northern, Central, and Southern Ranges of the Madras Presidency. In Assam the Vaccination Act is in force in all municipalities, and during the year under review it was extended to the towns of Barpeta, Karimganj, Sunamganj, and Maulvi Bazar. In the United Provinces it is in force in all municipalities and cantonments, and in 41 Notified Areas. The rules are enforced with a varying degree of energy in different localities. In the province of Delhi the vaccinatian work is carried on in the Municipal Town and the Notified Area. Vaccination is compulsory throughout the administrations of Ajmer-Merwara and Coorg. As regards the other provinces the number of towns or municipalities where the Act is in force is noted below.

Bengal in 113 towns or 95 per cent. of total.
Bombay in 113 towns or 57 per cent. of total.
Bihar and Orissa in 55 towns or 79 per cent. of total.
Punjab in 48 towns or 35 per cent. of total.
Burma in 57 towns or 90 per cent. of total.
Central Provinces and Berar in 61 municipalities or 54 per cent. of total.
North-West Frontier Province in 9 towns or 47 per cent. of total.

Vaccinations are conducted by the agency of a special department established for the purpose and to a small extent by the staff attached to the ordinary hospitals and dispensaries. Each province has a large establishment of public vaccinators, with an inspecting staff under the Deputy Sanitary Commissioners. The staff employed in 1915-16 consisted of 44 European and 583 Indian supervising officers and 6,289 vaccinators, the latter including 2,276 licensed vaccinators employed in Bengal, Bihar and Orissa, and Assam.

The table below shows the number of persons vaccinated, the number of deaths from small-pox, and the ratio of deaths per mille of population during the years.

	Number of persons vaccinated.	Population in which births and deaths were registered.	Deaths from Small pox.	Ratio of deaths from small-pox per mille of population.
1911-12	9,591,708	238,688,119	58,535	·25
1912-13	9,820,655	238,661,346	89,357	·37
1913-14	9,772,761	238,323,365	98,155	·41
1914-15	9,387,078	238,522,770	76,590	·32
1915-16	9,473,583	238,527,877	83,282	·35

The total number of persons vaccinated in 1915-16 was 9,473,583 against 9,387,078 in the previous year. Ten years previously, *i.e.*, in 1906-07 the number was 9,061,543 which represents an increase of 4·5 per cent. The ratio of persons vaccinated to the population of tracts where vaccination was in operation is 3·9 against 3·8 a decade ago. The primary cases by the special department numbered 8,208,679 in 1915-16 as compared with 8,146,236 in 1914-15 and the percentage of success was in these two years 96·1 and 96·5 respectively. Of the re-vaccinations, which increased from 1,181,180 in 1914-15 to 1,231,414 in 1915-16, 70·2 per cent. were successful against 69·2 in the previous year. Vaccinations at dispensaries continue to decline, there having been 131,990 operations in 1915-16 compared with 135,485 in the previous year.

On an estimated birthrate of 40 per thousand of population, 44·2 per cent. of the children under a year old was protected by vaccination in 1915-16 as against 44·9 during the preceding year.

The cost of the special vaccination department in 1915-16 was R17,89,389, the average for the preceding five years being R16,28,609. The bulk of the expenditure is defrayed from provincial, local, and municipal funds; the sum of R7,87,022 was contributed from provincial revenues, R7,26,468 from local funds, and

R2,43,744 from municipalities. The average cost of vaccination *per capita* works out at three annas and four pies in 1915-16. The cost per head was highest in Burma, nine annas and one pie, and lowest in Bihar and Orissa, one anna and five pies only.

DEATHS FROM WILD ANIMALS

During the decade 1906 to 1915 nearly a quarter of a million of human beings were reported to have been killed by wild animals. It is probable that many such deaths are not reported, and on the other hand it is also probable that some deaths are assigned to the action of wild animals which were not so caused. Of this number the majority, *viz.*, 224,705 persons died of snake-bite, and the remainder 20,598 persons were killed by other wild animals. The wild animals whose ravages are distinguished in the returns are the snake, the tiger, the leopard, the wolf, the bear, the elephant, and the hyena. Among unspecified wild animals which destroy human lives may be mentioned the alligator and crocodile, wild pigs, buffaloes, and wild dogs.

The average number of persons killed during successive quinquennia since 1876 is as follows :—

Five years ending—	Number.
1880	20,304
1885	22,357
1890	23,848
1895	23,979
1900	25,631
1905	24,757
1910	23,781
1915	25,279

The average annual mortality from snake-bite rose from 21,571 in the quinquennium ending 1910 to 23,370 in the last quinquennium. In 1915, there were 26,406 deaths from this cause against 22,900 in the previous year. The following provinces contributed to the increase :—Bihar and Orissa 6,795 against 5,968 in the previous year, the United Provinces 6,629 against 5,513, Bengal 4,709 against 4,356, Bombay 1,789 against 1,608, the Punjab 1,590 against 1,169, Burma 1,558 against 1,312, Central Provinces and Berar 1,439 against 1,198, Assam 256 against 150, Ajmer-Merwara 53 against 44, and Delhi 36 against 22 in the previous year. In Madras, however, the mortality under this head decreased from 1,520 in 1914 to 1,519 in 1915.

It is noticeable that there were in the year under review nearly twelve deaths from snake-bite for everyone caused by other wild animals, the number of deaths due to this cause being 26,406 against 2,276 persons killed by other wild animals. After the snake, the tiger is the most destructive beast and is responsible for 1,096 deaths, the leopard accounted for 269, and wolves and bears for 286. Elephants and hyenas were responsible between them for 105 deaths. Of the 519 deaths attributed to other animals 247 are assigned to alligators and crocodiles, 181 to wild boars and pigs, 37 to wild dogs, 14 to wild buffaloes, one to gharial, one to shark, one to goira, and 37 to unspecified animals.

	Number.	Ratio.
Bihar and Orissa	7,479	217
United Provinces	6,806	144
Burma	1,624	134
Central Provinces and Berar	1,600	115
Bengal	5,132	113
Bombay	1,835	93
Delhi	37	90
Punjab	1,595	82
Assam	403	60
Madras	2,070	59

The marginal table shows the total number of persons killed by wild animals and the ratio of deaths per million of the population in the year 1915 in each province. Bihar and Orissa heads the list with a ratio of 217 per every million of the population. The United Provinces come next with a ratio of 144 and then Burma with 134, followed by the Central Provinces and Berar and Bengal with a ratio of 115 and 113 respectively. In Bombay the ratio was above 90. In Delhi it was 90 and in the Punjab 82 while in the other provinces the ratio was 60 and below.

NOTE.—These figures include criminal lunatics table No. 25

(a) Including 287 patients (males 206 and females 81) transferred from Colaba and Poona Asylums to the Central Asylum, Yeravda

(b) The actual figure representing the total population of the Asylum is 1,450 (males 1,170 and females 280.) The difference between this figure and 1,737 shown in the table is due to 287 patients transferred from Colaba and Poona Asylums to the Central Lunatic Asylum, Yeravda, having been taken into account in the Provincial report both under Colaba and Poona and Central Lunatic Asylums, Yeravda

(c) Inclusive of two patients received by transfer from one Asylum to another

(d) Inclusive of five observation cases found sane

(e) Inclusive of one male patient received by transfer from Berhampur Central Lunatic Asylum

NOTE.—The difference between the number of operations and the number of persons vaccinated shown in Table No. 32 is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations but not to the number of persons vaccinated

(a) Excludes 1,867 operations performed in Tea Gardens in Jalpaiguri, the details being not available

(b) Includes re-vaccinations

No. 35.—COST (in rupees) of the SPECIAL VACCINATION ESTABLISHMENT in BRITISH INDIA, COST of each SUCCESSFUL CASE, and the SOURCES from which the EXPENSES were paid

NOTE (1).—The difference between the number of operations and the number of persons vaccinated is due to second operations performed on account of failure on the first occasion; second operations, it may be explained, add to the total number of vaccinations, but not to the numb r of persons vaccinated

(2).—No vaccination is performed by the Dispensary Establishment in Delhi and Ajmer-Merwara

(a) In Bengal the statistics show particulars of vaccination performed by vaccinators attached to Municipalities, Jails, Cantonments, and Railways, etc. The number of such vaccinators during 1912-13, 1913-14, 1914-15, and 1915-16 were 132, 129, 143, and 163 respectively. The average number of persons vaccinated by each vaccinator in those years being 708, 701, 8·0 and 698 respectively. In other provinces the statistics relate to vaccinations performed by Civil Surgeons or medical subordinates attached to dispensaries as there are no special vaccinators attached to them

(b) Includes re-vaccinations

No 37.—TOTAL VACCINATIONS effected by the SPECIAL VACCINATION and DISPENSARY ESTABLISHMENTS (combined) in BRITISH INDIA

Province		Total number successfully vaccinated			Ratio of successful vaccinations per 1,000 of population (*b*)	Annual average of successful vaccinations performed by the Department during the five years previous to each year entered in this table		Average annual deaths from Small-pox during the five years previous to each year entered in this table

APPENDIX.

Resolution of the Government of India, Department of Education, Sanitary, Nos. 888-908, dated the 23rd May 1914.

Historical summary.

The Modern history of scientific sanitation in India may be said to date from the end of the last century. Previously there had indeed been periods of useful spade work and spasms of general sanitary activity. A Royal Commission, appointed in 1859 and reporting in 1863 recommended the formation of commissions of public health in the presidencies of Madras, Bombay and Bengal, with a view to the diminution of sickness in the army, and the improvement of the health of the general population. These commissions were appointed but were soon replaced in each presidency by a sanitary commissioner with an assistant. Sanitary inspectors general, afterwards called sanitary commissioners, were appointed in other provinces and the sanitary and vaccination staffs were gradually amalgamated. In 1888 Lord Dufferin's Government issued a resolution drawing the attention of local bodies and village unions to their duties in the matter of sanitation; and sanitary boards were formed in every province. But comparatively little success attended these efforts except in the larger towns. On the one side, sanitary measures and systems of western countries were applied to India without due regard to the fundamental differences of western and eastern civilisations and of the conditions of life in tropical and temperate climates: on the other side, the people were unprepared for reform or any kind of change.

2. The ravages and horrors of plague and the discoveries resulting from medical research made some real impression on the educated community in India; and a demand gradually arose for sanitary surroundings and preventive measures, such as had not been known before. Individuals left their insanitary quarters for cleaner and healthier localities and in increasing numbers men began to realise the dangers to which they were exposed from existing conditions, and to appreciate the economic value of health and the wastefulness of sickness and premature death. Dislike of action was, however, for long persistent even among the educated. So far as the uneducated masses were concerned their apathy, fatalism and resentment of interference constituted a formidable obstacle to all sanitary progress.

3. The Governments in India have moved more rapidly of late. In 1898, the Government of India issued an important statement of policy. In 1908, imperial grants amounting to Rs. 30,00,000 (£200,000) a year were made to local Governments. A new department of the Government of India were created in 1910 in order to relieve the Home Department of education, sanitation and some other branches of the administration. In addition to sanitary

Recent activity.

conferences held by local Governments, three all-India sanitary conferences have been convened at Bombay, Madras and Lucknow, respectively, over which the Honourable Sir Harcourt Butler presided as Member of the Governor General's Council in charge of the department concerned. These conferences were attended by non-officials as well as officials, by laymen as well as professional sanitarians. Again, the Indian Research Fund Association has been founded to further the prosecution of research, and the propagation of knowledge and experimental measures generally in connection with the causation, mode of spread and prevention of communicable diseases. To this fund the Government of India make an annually recurring grant of 5 lakhs of rupees (£33,333). Moreover, since the constitution of the new Department of the Government of India, imperial grants have been made to local Governments and Administrations to the amount of Rs. 4,61,47,000 (£3,076,466), of which Rs. 55,23,000 (£368,200) are recurring, and Rs. 4,06,24,000 (£2,708,266) non-recurring. In addition, grants amounting to Rs. 82·33 lakhs (£548,866) a year have been made to district boards in certain provinces, a substantial portion of which will, it is hoped, be expended on rural sanitation. These grants have rendered practicable the execution of schemes which a few years ago seemed beyond the limits of financial possibility; and there can be little doubt that the movement for sanitary reform is now well established and progressive throughout the country.

4. There has thus been progress although the rate has hitherto been slow. In the land of the ox-cart one must not expect the pace of the motor car. The truly remarkable improvements effected of late years in the health of the army in India, in the case of Indian no less

than British troops,* cannot be expected in connection with the civil population. In the case of the army, the problem is concerned mainly with well nourished adults, all of whom are selected lives, living in sanitary surroundings, under military discipline. Moreover, so soon as a soldier becomes unfit for active service, he leaves the army and forms part of the civil population. In the case of the civil population, the conditions of the problem are very different, and sanitary reform has still to grope its way through a labyrinth of difficulties. In order to be successful it must conform to three cardinal principles :—

Cardinal principles.

(1) it must rest on a knowledge of the people, their conditions of life, their prejudices, social customs and habits, their surroundings and financial means ; and it must secure their co-operation ;

(2) it must recognise the diversity of local conditions in a country which includes numerous communities, castes and creeds and which exhibits almost every variety of climate, temperature, humidity and level of sub-soil water, from the deltas of Bengal with their steamy atmosphere and dense lush vegetation to the burnt brown hills of the north-west frontier ;

(3) its introduction must be preceded by preliminary local surveys, inquiry, or experiment.

5. As a result of the Plague Commission's Report Lord Curzon's Government took up with vigour the reorganisation of the sanitary department. Research institutes were started and an appointment of Sanitary Commissioner with the Government of India was created. The functions of this officer were to advise the Government of India upon sanitary and bacteriological questions, to settle with local Governments the principle on which an advance should be made and to organise and direct research throughout India. The arrangement was not completely successful. Among the disadvantages, the separation of research from clinical work deterred men from entering the department, and the office work in connection with research prevented the Sanitary Commissioner from undertaking wide and constant touring. The organisation was accordingly modified in 1912. The Sanitary Commissioner is now the independent adviser to the Government of India in all technical and sanitary matters, but all questions of personnel as well as the administration of the bacteriological department and research generally have been placed under the control of the Director General, Indian Medical Service, with the Sanitary Commissioner as his staff officer.

Sanitary organisation.

6. The sanctioned strength of the superior sanitary organisation in India now is :—

(*a*) A Sanitary Commissioner with the Government of India.

(*b*) A bacteriological department comprising—

(*i*) thirteen laboratory appointments distributed as follows :—

Central Research Institute . . .	1 Director and	3 Assistants.
Bombay Bacteriological Laboratory . .	1 „ „	2 „

In their resolution, dated the 23rd May 1912, the Government of India provided for a large increase in the number of Deputy Sanitary Commissioners and for the appointment of health officers (of the first-class for larger municipalities and of the second-class for the smaller towns) on the lines of detailed proposals received from local Governments. Twelve additional appointments of deputy sanitary commissioner, thirty-five appointments of health officer of the first-class and a large addition to the number of second-class health officers were sanctioned in 1912 and 1913, the entire cost of the additional deputy sanitary commissioners on the basis of the scale of pay fixed for Indians and half the cost of the health officers being met by imperial grants. The Government of India also advised local Governments to take powers, where these did not exist, to require a municipality to appoint a health officer and to veto the appointment of an unfit person. Such powers already exist in the Bombay presidency, and have recently been taken by legislation in Bengal. Simultaneously, the Government of India recommended the system in force in Madras whereby every municipality is required to employ one or more trained sanitary inspectors in proportion to population. Sanitary inspectors are now being employed in large numbers in towns. In addition, the civil surgeon in every district is the sanitary adviser of the local authorities and in most provinces controls the vaccination staff. The provision of an increased staff of sanitary engineers is engaging urgent attention.

The Government of India attach great importance to the organization of voluntary agencies and have recently made a grant of Rs. 20,000 (£1,333)—a sum equivalent to that given by the Bombay Government—to the Bombay sanitary association, which was founded in 1903, and now has corresponding branches in several districts and native states.

7. The policy of the Government of India is to keep the control of research under itself, but to decentralise other branches of sanitation. The creation of an imperial department is no departure from that policy, and the large imperial grants already mentioned have been made without any interference with provincial Governments. While the general direction of a policy of public health must remain with the central Government, all detailed control and executive action are, and will be, left to local Governments. The Sanitary Commissioner with the Government of India is a touring officer empowered to consult and confer informally with local Governments and their officers upon matters connected with sanitation. He is not permitted to encroach upon the authority of local Governments over the officers under their control.

(*a*) Appointments of health officer in presidency towns and Simla are not included.

(*b*) Five of these are temporary appointments.

(*c*) In addition to the officers shown in this statement, the Director, Vaccine Institute, Belgaum, is also a sanitary officer.

(*d*) There is also a temporary appointment.

(*e*) Temporary.

(*f*) One of these is temporary.

(*g*) The administrative Head of the medical department is also the Sanitary Commissioner.

(*h*) There are also four 3rd-class health officers in the province.

(*i*) The Sanitary Commissioner with the Government of India is also Sanitary Commissioner, Delhi.

(*j*) Two of these are temporary.

8. The position of provincial sanitary commissioners towards the administrative heads of the medical department varies somewhat in different provinces. The Government of India do not wish to interfere with the arrangements which local Governments may consider best suited to local conditions, but they desire to insist on the importance of defining the functions of the two officers and securing to the sanitary commissioner the position of responsible technical adviser to the local Government in all matters affecting public health.

9. In every province, sanitary boards have been composed with varying powers, some being merely advisory, others having authority to sanction schemes and allot funds. These boards are composed of officers belonging to the medical, sanitary, engineering and other branches of the civil services with the addition of non-officials. The Government of India view with favour and confidence the devolution of financial authority and resposibility to these boards, and they commend to local Governments the appointment of a permanent salaried secretary to the board where this has not been done. They believe that such an appointment, wherever made, has resulted in an increase of efficiency.

10. Arrangements for training the superior sanitary staff are now engaging the attention of the Government of India. The chief difficulty at present is to provide courses in practical hygiene and in the study of the bacteriology and etiology of tropical diseases. It is hoped in the near future to make arrangements in India for the former and to utilise the schools of tropical medicine at Calcutta and elsewhere for the latter. Meanwhile a British diploma in public health is required from candidates for the post of deputy sanitary commissioners and health officers of the first class. The problems of public health in India are vitally complicated by the fact that biting insects are a prominent factor in the dissemination of disease, and it is obviously desirable to provide in India, as soon as possible, a complete course of training for sanitary officers.

Training of staff.

Training classes for sanitary inspectors are now held in all the more important provinces.

11. A substantial beginning has thus been made for the development of a department of public health and Indians have been freely enlisted for it. The posts of deputy sanitary commissioner and health officer are now open to Indians. Nine deputy sanitary commissioners out of 26 and the majority of health officers are Indians. The new bacteriological department consisting of 28 officers is also open to duly qualified Indians.

As health officers and sanitary engineers gradually relieve deputy sanitary commissioners of much of the drudgery of inspection and routine work, it is hoped that the latter will be set free to deal with epidemics and communicable diseases from a higher plane, and to consider issues of public health wider than those which they are able to review to-day. It is, therefore, important to provide in advance free interchange between them, the laboratory workers and those carrying out practical research in the field.

12. Research is slowly lifting the veil which hides the secrets of disease and mortality and opening up fields of inquiry scarcely thought of a generation ago. The discovery by Sir Ronald Ross of the part played by the mosquito in the communication of malaria and the appointment of the Plague Commission in 1898 are landmarks in the history of Indian Sanitation. In 1902, a research institute was founded at Guindy in Madras, named the King Institute after Lieutenant-Colonel King, C.I.E., I.M.S., in view of his devoted efforts in the cause of sanitation in that presidency. In 1905, Lord Curzon's Government summed up the position and the policy of the Government of India in regard to the establishment of laboratories for the study of problems of public health in India. The functions of the central laboratory were original research, the preparation of curative sera and the training of scientific workers. The functions of the provincial laboratories were diagnosis and special research connected with local conditions. This policy has been steadily developed. The Central Research Institute has been established at Kasauli. The Plague Research Laboratory at Parel has been extended and re-equipped and is now the bacteriological laboratory for the Bombay presidency and a proposal is under consideration to attach to it a school of tropical medicine. A research laboratory and school of tropical medicine are under construction at Calcutta. Pasteur Institutes exist at Kasauli and Coonoor. A third is about to be established in Burma, and it is under discussion to establish others in Assam (where it will be combined with a research laboratory) and Bombay.

Research.

Besides the routine work connected with the bacteriological diagnosis of disease anti-rabic treatment, the manufacture of various vaccines and sera and general research, these laboratories at different times have been the centres of many special investigations, notable amongst which are those on plague and enteric fever. It is hoped that before long each province in India will have a laboratory fully equipped for research.

13. The foundation of the Indian Research Fund Association in 1911 has marked an important era in sanitary progress. The control and management of the association are vested in a governing body, the president of which is the Member in charge of the Education Department of the Government of India. The governing body is assisted by a "scientific advisory board" of which not less than three members have seats on the governing body. They examine all proposals for work in connection with the scientific objects of the association and report as to their importance and feasibility. The members of this board are appointed

Indian Research Fund Association.

for one year, but are eligible for re-election, and they have power to add to their number. The present members are the Director-General, Indian Medical Service, the Sanitary Commissioner with the Government of India, the Director of the Central Research Institute at Kasauli, the Officer in charge of the Central Malarial Bureau and the Assistant Director-General, Indian Medical Service (Sanitary) : Sir Ronald Ross has been elected an honorary consulting member. The membership of the Indian Research Fund Association is open to non-officials. Every donor of Rs. 5,000 is entitled to become a permanent member, while every subscriber of Rs. 100 per annum can be a temporary member. Members of the association are entitled to attend and take part in the annual general meeting of the association and to receive copies of the reports and other publications issued from time to time by the association. Although, so far, the fund has been financed solely by the Government of India, it is hoped that in time Indian philanthropists will contribute towards the expansion of the association by founding chairs of research, by financing experimental research measures and otherwise.

14. The association has been active and can already point to some achievement. Out of an income of Rs. 15 lakhs (£100,000) received since its incorporation and up to the end of 1913-14, an expenditure of over Rs. 14 lakhs (£93,333) has been sanctioned. In 1911, Major S. P. James, I.M.S., was deputed to study yellow fever in its endemic area and to draw up proposals for protecting India against the introduction of the disease. Those proposals are still under consideration. In the meanwhile, stegomyia surveys have been carried out in Calcutta, Bombay, Madras, Karachi and Rangoon and other seaports. Anti-malaria schemes based on preliminary surveys have been carried out at a cost of Rs. 6,02,000 (£40,133). Investigations are at present in progress into the problems connected with the prevalence of cholera, kala-azar, dysentery, leprosy and goitre, as well as inquiries into the pharmacology of cinchona derivatives, the use of hydrocyanic acid gas as a pulicide and the fixation of chemical standards of purity for milk and milk products Other investigations are under consideration regarding bacteriological standards of purity for water-supplies, the different anti-cholera vaccines and sera, the methods of water filtration and silt removal best suited to Indian conditions, and the etiology of diabetes and the fevers of short duration. These will be started so soon as more trained research workers are available. It is hoped also to carry out, during the next non-epidemic season, an experiment in plague prevention on a large scale on the lines indicated in paragraph 22.

15. Besides financing the investigations conducted by its own staff, the association gives grants-in-aid to outside research on approved lines. The co-operation of other workers has been sought, and every encouragement has been given to them. Grants for research have been made, for instance, to Professor MacMahon, Dr. Hossack and Mr. Howlett. The services of Indians have also been enlisted. Dr. Korke is engaged in an important investigation into kala-azar, while Mr. Awati, a medical entomologist, s employed under the association. The Government of India cordially approve the policy of encouraging private enterprise in the cause of research.

16. The association has also started a journal for the publication of medical research work done in India—the "Indian Journal of Medical Research"—published quarterly. The favourable reception which has been accorded to the first three numbers is evidence of the increased interest that is being taken in sanitary science in India to-day.

17. The investigations enumerated above represent the work directly under the supervision of the Government of India. The local Governments also are fully alive to the importance of research, and in seven provinces nine special officers are at present engaged in investigating the causes underlying the local prevalence of malaria and devising suitable schemes for the mitigation of that disease.

Malaria.

18. It remains to consider the results of research as applied to the chief tropical diseases, always remembering that they are liable to revision or modification in the light of further investigation and discoveries. The most important tropical disease is malaria. After allowance has been made for the tendency to attribute to fever deaths from other causes, malaria stands out as universally prevalent in India and in many tracts is a scourge far greater than either plague or cholera. It maims as well as kills and causes more sickness, misery and death than any other single disease. Measures for the prevention of malaria aim at breaking the cycle of infection in two ways, (*a*) by attacks on the parasites in man, and (*b*) by the destruction of mosquitoes. To the former class belong the different systems of quinine prophylaxis and treatment; and to the latter, all those measures which aim at abolishing mosquito breeding grounds. Both methods have been successful in other countries and both have been tried extensively in India. The following propositions represent the experience gained up to date :—

(1) The conditions and causes underlying the prevalence of malaria vary greatly in different places, and no one anti-malarial measure is suitable for all.

(2) Quinine both as a prophylactic and curative agent is of great value to the individual. Its powers of saving life, alleviating sickness and destroying sources of infection cannot be over-estimated. There should be no relaxation in the efforts to educate the people in the use of the drug: and its sale by shopkeepers in rural areas might well be encouraged.

(3) The regular administration of quinine to children in schools during the malarial season is a practical measure of easy application and of proved utility, it is valuable alike for its immediate good effects on the health of the scholars and as a means of spreading knowledge of the use of quinine.

(4) In any community under control quinine prophylaxis properly carried out is a valuable weapon in the fight against malaria: in India with its free population, the ignorance and apathy of the masses, their prejudice against the drug, their objection to medicine when not actually suffering from illness, and the fact that it must be continued over an indefinite number of years, greatly limit the value of quinine prophylaxis.

(5) In anti-larval operations it is not necessary to abolish all breeding grounds of mosquitoes, even of known carriers of malarial infection: a marked amelioration in health conditions will ensue if the chief breeding grounds of the malaria carrying mosquitoes are cleared.

(6) Malaria surveys have brought to light important and unexpected facts regarding the causation of malaria in particular localities. For instance, the enquiries of Major Liston and Dr. Bentley in Bombay disclosed the fact that malaria did not arise from the swampy surroundings of the city and that the malaria-carrying mosquito was *N. stephensi* which bred in the numerous wells attached to private houses. Again, Major Christophers has demonstrated that malaria in the Andamans is due to a species of mosquito *M. ludlowi* which breeds in the brackish water of the creeks and that the mosquitoes infesting the rice-fields in the neighbourhood are innocuous.

(7) Notwithstanding the initial expense, those anti-malarial measures should be chosen which will act automatically, be independent of outside help and permanent in their effects: those which require regular repetition, constant attention or active co-operation on the part of the people, are, under present conditions, seldom durably effective.

(8) The treatment of permanent collections of water is important whether it be effected by (*a*) water tidiness, through sloping of banks and clearing of weeds, or (*b*) stocking with fish of proved utility as mosquito destroyers, or by both methods.

19. The Government of India have arranged classes for instruction in practical malaria work twice a year. The course is so planned that each member of the class takes an actual part in the preparation of a malaria survey which will eventually be the basis of a practical scheme of malaria prevention. Already 155 medical officers in civil and military employ have passed through the classes. It is hoped before long to spread a large number of trained and active workers over the whole of India.

The Lucknow Sanitary Conference recommended that a malariologist and engineer should be deputed to Italy to study the methods of "colmate" and "bonificazione" under the auspices of the Indian Research Fund Association, and it is hoped to arrange for their deputation. The effect of silt deposit on the malarial conditions of deltaic areas in India is also receiving attention; and interesting experiments are being conducted by the Government of Bengal at Berhampur. Experiments in clearing jungle and undergrowth will shortly be undertaken.

Plague.

20. The Plague Research Commission, which was constituted in 1905 and is still continuing its investigations, has thrown much light on the etiology and epidemiology of the disease. The chief conclusions that have been reached so far may be summarised as follows:—

(1) In India, where the pneumonic form of the disease is relatively rare, plague is essentially a disease of rats communicable to man and a few of the lower animals; an epidemic amongst men is directly dependent upon an epizootic amongst rats.

(2) Plague spreads from rat to rat and from rat to man through the agency of the rat flea.

(3) The plague bacillus under natural conditions does not long retain its vitality outside the body of the rat, the rat flea, or man.

(4) Plague has a definite seasonal prevalence, generally constant for any given place but varying in different parts of India; investigation shows that the plague season coincides with the season of maximum prevalence of rat fleas.

(5) Infection is carried from place to place only over very short distances by the spontaneous movements of rats: in other cases, infection is carried either (*a*) by the agency of man or personal effects acting as a means of transport for infected fleas, or (*b*) by means of merchandise, chiefly grain, which may contain rats as well as fleas. It is not yet established which of these two agencies is the more important, but recent work, both in India and the Far East, has emphasised the importance of grain as a vehicle for the transmission of infection

(6) In comparatively few places in India does plague infection survive the adverse conditions of the non-epidemic season; such places are usually either (*a*) large towns, or (*b*) places which have been infected late in the epidemic season.

(7) In places which have suffered from repeated and severe epidemics of plague, the rats have become less susceptible to plague than are the rats in places which have remained plague-free or have suffered but slightly.

21. These conclusions have been arrived at after much careful and painstaking research and constitute a great advance on the knowledge of plague, which was available when, in 1896, it first appeared in Bombay. They point, apparently, to a simple solution of the plague problem—no rats no plague. But this solution is not attainable unless the population concerned is convinced of the danger of living in close association with the rat and is ready to co-operate in its extermination. Unfortunately, attempts at rat destruction by trapping or poison frequently meet with active opposition. Experience in India suggests that owing to the excessive fecundity of the animals, general rat destruction, even when applied to extensive areas, gives only a temporary reduction of rat infestation and has a limited sphere of usefulness as an anti-plague measure.

22. In one direction, however, well directed efforts at rat destruction may prove useful. In each epidemic a number of places are infected late in the season and in certain of these plague survives the non-epidemic period only to break out in a virulent form when the conditions of spread again become more favourable. These localities are potential foci of extensive infection. It would seem important to concentrate the energies of the plague preventive staff on them in well organised schemes of rat destruction carried out during the quiescent period before the commencement of the next epidemic season.

23. Much can be done, indirectly, to reduce the number of rats in towns and villages, by diminishing their food supply. In any place the number of rats is in proportion to the quantity of food which they can obtain. Efficient scavenging and the protection of foodstuffs from the depredations of rats are important from this point of view. The markets, grain stores, and shops, in most parts of India, are so placed and constructed as to give food and shelter to large numbers of rats. Experiments are being carried out with a view to discovering the best practical means of disinfecting grain stores and godowns. It is not practicable at present to remove grain markets and godowns outside towns, to prevent them from being used as dwellings for men, to insist on solid masonry buildings, or to prohibit the stabling of horses and cattle in the precincts of dwelling houses. But these measures and the storage of grain in bulk instead of in bags may, with the progress of education, hereafter enter the zone of practicability. The exclusion of rats from houses is important. In several provinces experiments with different types of so-called rat-proof houses have been made with varying degrees of success. The results suggest that no form of house could remain rat-free for long in India owing to the habits of the people. Even were this not the case it would obviously be impracticable, for financial reasons, to render dwelling houses in the towns and villages of India rat-proof on anything like a large scale. On the other hand, the individual can protect himself by providing his house with masonry floors and walls and windows enough to give ample light and air to every room and by preventing accumulations of rubbish amongst which rats can build their nests. The rat requires shelter for breeding, is mainly nocturnal in its habits and prefers darkness to light.

24. Three other measures remain to be considered—evacuation, disinfection and inoculation. The evacuation of all houses in large towns, on the occurrence of rat mortality therein or human plague cases in adjacent dwellings, is rarely possible, but in villages and parts of smaller towns it is a valuable means of checking an epidemic of plague. Disinfection to be efficacious should be directed against the rat and the rat-flea. It is of little value when it leaves both untouched. The practical objections to compulsory inoculations with anti-plague vaccine on a large scale continue; but the safety and efficiency of inoculation as a personal preventive measure against infection has been abundantly proved, and in certain areas the prejudice against it appears to be diminishing. The Government of India desire that every facility should be afforded to any one wishing to obtain this protection for himself or his family and they commend to local Governments the employment of carefully selected private practitioners to this end.

Cholera.

25. Cholera is now much less prevalent than formerly, but frequently occasions severe epidemics and still remains a constant cause of mortality. Epidemics have in several recent cases been traced to pilgrims returning from places of religous pilgrimage, at which there had been no recognised outbreak of the disease. In 1912, Major Greig was deputed to make a special investigation of the whole subject. That investigation, which still continues, has added to knowledge regarding the propagation of cholera and has established the fact that not only cholera convalescents, but also healthy persons who have been in contact with cholera cases, can act as "carriers" of the disease. It has also been shown that the germs of the disease can be recovered from a patient's dejecta kept under natural conditions for a variable but frequently considerable period, and that flies may play an important part in the dissemination of infection. These observations, while in no way opposed to previous knowledge that cholera is a water-borne disease, accentuate the importance of careful and thorough conservancy.

Small-pox.

26. Small-pox is not a tropical disease, but it used to be so rife in India as to be associated among Hindus with its own special goddess. It now occupies a small place in the mortality returns. This result is due to the spread of vaccination during the latter half of the last century.

Vaccination.

Formerly, nearly all vaccination was effected by human lymph, but within recent years arm-to-arm vaccination has been steadily replaced by the use of pure glycerinated or lanolinated calf lymph. The change has been doubly beneficial; it does away with the necessity of breaking the vesicle in the child's arm, a simple operation but one which exposes the wound to contamination by extraneous germs; and it ensures that the vaccination is effected with a pure and fully potent lymph with consequent increase of protection. The change has been especially welcomed by educated Indians. Madras, Bombay, Bengal, Burma, the United Provinces, the Punjab, the Central Provinces and Assam have each now their own calf lymph depôts, and the opening of another for the province of Bihar and Orissa is under consideration. Grants of Rs. 2,00,000 (£13,333), were given from imperial revenues last year to improve the depôts in the United Provinces, the Punjab and Burma, and to establish the new depôt in the Central Provinces.

Tuberculosis.

27. The prevalence of tuberculosis throughout India especially in the large cities is undoubted. In some of the latter, the mortality exceeds that of certain crowded European cities. The difficulties of coping with the disease in India are immense and demand the fullest co-operation between Government and private agency. One or more officers will be detailed to investigate the causes underlying the disease, to organise the diffusion of information, and to advise regarding measures for the prevention of infection: the services of Dr. Lankester have already been secured by the Indian Research Fund Association for this purpose. Recent research appears to show that tuberculosis in India is chiefly human and not bovine in origin. Indian cattle so far as is known are practically free from the disease, and Indians do not as a rule drink unboiled milk. The source of the disease is in the homes of the people, and the relief of congested areas and the provision of sufficient light and air in human tenements are preventive measures of great value. The Government of India invite attention to the recommendation of the Lucknow sanitary conference that circumspection should be exercised before instituting at considerable cost further large sanatoria. They consider that inexpensive buildings suitable as model dwellings for the people may prove of great educative value and they desire to encourage tuberculosis hospitals and dispensaries. They also take this opportunity of communicating the warning of the Lucknow conference against the indiscriminate use of tuberculin by unqualified medical practitioners.

Infant mortality.

28. No summary of public health is complete without a reference to infant mortality. In 1911, of 4,752,152 male children and 4,457,551 females born in India, 1,016,823 males and 873,677 females died. In other words, about one-fifth of the children born died within the first year of their life. It is difficult to arrive at the actual causes of this high rate of mortality. The figures at the disposal of Government are often of doubtful accuracy, and the comparison of figures from different localities is frequently fallacious. On a broad view of the subject the causes of infant mortality may thus be summarised: (1) malaria operating both directly on the infant and indirectly through the mother; (2) diseases due to insanitary surroundings and exposure to infection especially through the medium of flies; (3) diseases due to ignorance on the part of the mother with regard to the feeding and care of the infant; (4) accidents of child birth and diseases attendant thereon. For (3) and (4) the custom of early marriage and the primitive and insanitary methods of midwifery are largely responsible. The latter lead directly to the death of the infant from tetanus and other diseases, and indirectly increase the infant mortality by depriving children of their natural nourishment either through the death of the mother or the failure of her milk as the result of sepsis. Deficiency in the supply of cow's milk has not been proved to be a predominant cause of infant mortality in India; but the question of improving both the quality and the quantity of the milk-supply without increasing its cost is engaging earnest attention (*vide* paragraph 42).

It is hoped that the instruction of mothers and midwives will engage the attention of all medical women practising in India and especially interest the women's medical service which has recently been established. In some of the large cities in India, notably Calcutta, Bombay and Madras, nurse health visitors have been appointed by municipalities to visit the people in their homes and assist and instruct mothers in the elementary principles of hygiene. In Bombay, an interesting experiment has been started by Dr. Turner in the form of lectures to the midwives. Another is likely to be made under the auspices of the Indian Research Fund Association in Delhi, where it is proposed to detail two trained nurses for work as health visitors.

Vital statistics.

29. The course of sanitary reform is much impeded by the want of complete and accurate vital statistics. Without them it is difficult to gauge the effects of sanitary measures or to convince people of their efficacy. The difficulties in the way of improving the reporting and recording agency especially in rural areas are great; but systematic checking and supervision

of returns should yield good results. Dispensary returns and voluntary notification by private medical practitioners are useful as checks but are only partial in their scope. A comprehensive scheme for the improvement of general reporting is required. The Government of India invite the attention of local Governments to the importance of the subject.

30. The Government of India recognise that differences in local conditions preclude the issue of any general instructions but they commend the following propositions for consideration :—

(*a*) The reporting of vital occurrences should not be left exclusively to the municipal staff; reporting by the head of the household also should be insisted on. The two reports would then be available to check one another.

(*b*) The actual registration should be done not as an extra duty but by special registrars who should, if possible, possess a medical qualification. In the case of deaths, inquiries regarding the symptoms of the deceased could then be made from the person reporting and some check on the diagnosis of the cause of death could be obtained. Many people are attended during their last illness by unqualified persons or die without medical attendance.

(*c*) The registrar should be required to verify at least 10 per cent. of the reported births and deaths and this verification should, as far as possible, include all particulars such as cause, date, age, sex, place, etc.

(*d*) The health officer should be in charge of the vital statistics in the town and should be responsible for supervising and checking the work.

(*e*) Experiments might be made in obtaining accurate registration in typical areas by means of a special staff which would also be employed in healing the sick.

Sanitary surveys.

31. Concurrently with attention to the registration of vital statistics the Government of India commend to local Governments the importance of sanitary surveys on broad lines. Something has been done in this direction and valuable reports have been drawn up, giving the real health conditions of towns and particular localities and indicating the existence of any special sickness or mortality and the definite causes underlying them. The Government of India desire that systematic working plans should be drawn up where this has not already been done with a view to mapping out the sanitary conditions of all the more important towns and localities in which sickness or mortality is above normal. This will occupy years of steady preparation; but as deputy sanitary commissioners are relieved of much of the routine work which at present they have to perform they should be able to carry this undertaking to a successful issue. The preparation of drainage surveys in towns in advance of needs obviates waste in the long run. In the absence of such surveys, work is often commenced in a haphazard way without due consideration of a scheme as a whole.

Urban sanitation.

32. Urban sanitation has as already observed, received much attention of late years. It falls generally under four heads, *viz.*, conservancy, water-supply, drainage and town-planning with improvement of housing and the relief of congested areas. In the forefront of these stands conservancy.

Conservancy.

33. The importance of efficient scavenging with speedy and complete removal of all night soil and rubbish from the vicinity of habitations and its satisfactory disposal can scarcely be exaggerated. Yet probably no department of public health work is more neglected in many Indian towns. The strict rules of the caste system have for centuries relegated everything connected with this work to the outcast, and the people, as a rule, evince little if any interest in the conservancy even of their own houses. To this neglect must be attributed the plague of flies which at certain seasons is experienced in every Indian town. Apart from the discomfort which they cause, flies are known to be the disseminators of many diseases, including cholera, enteric fever, turberculosis, dysentery and diarrhœa and are largely responsible for the heavy mortality amongst infants. The all-India sanitary conferences at Madras and Lucknow drew prominent attention to the danger to health caused by the presence of these noxious insects, and the results of the recent "anti-fly" campaign at Delhi suggest that a large reduction in the number of flies is by no means an impossible task.

34. Whether incineration or shallow trenching or either of these methods of conservancy combined with water carriage is the best in any particular case will depend very largely on local conditions and customs. With the extension of drainage and sewerage systems, water carriage of all night-soil, with ultimate disposal on sewage farms, should give the best result. In the majority of towns, however, it will be long before this is generally practicable and the choice rests between incineration and trenching. Of the two methods, incineration is safer and on this account, if conditions permit, is preferable. Trenching is often thought to be more economical; but the profits obtainable from the trenching or pitting of night-soil and sale of the poudrette disappear, or are largely reduced, when the expense of carriage and supervision is taken into account. The material consideration in all cases is that the removal and disposal should be prompt. As education spreads and the number of health officers and sanitary inspectors increases, improved results may be anticipated.

Water-supply.

35. Few subjects have received more attention of late than the provision of a piped supply of filtered water in towns. Complete figures are not available but sums amounting to at least Rs. 3,51,58,297 (£2,343,886) have been spent during the last 20 years on completed schemes. Projects costing Rs. 1,40,03,433 (£933,562) are under construction and projects costing Rs. 1,14,44,750 (£762,983) have been prepared and sanctioned. These figures are exclusive of the expenditure in the presidency towns and Rangoon.

36. The demand for piped and filtered water-supply grows, and is likely to grow more rapidly in future. While recognising the need for treating the question with due regard to local conditions, the Government of India offer the following general observations:—

(*a*) When piped water-supplies were first introduced, in the face of opposition, it was necessary that the charges should be made as low as possible. That stage has now been passed, and there appears no good reason why water-supplies should not be conducted on a business footing and the water charged for like any other commodity. An interesting discussion on the financing of water-supplies was introduced by the Honourable Mr. Curtis at the Madras sanitary conference.

(*b*) On the whole, the provision of piped filtered water in towns has not been followed by that reduction in water-borne disease which might have been expected. This is probably due in most cases to the large number of wells, both public and private, which still remain in use. The closure of many of these wells is much to be desired, but the owners are unlikely to consent to this so long as the piped supply is intermittent and is drawn off hot or unpleasantly warm during the summer. In any case the substitution of a constant for an intermittent supply will shortly have to be considered as pipes get older and insuction declares itself. The warmth of the water is more difficult to deal with, but much might be done by burying pipes deeper in the ground and carrying house pipes inside instead of outside houses.

(*c*) Excessive wastage is common and causes not only an unnecessary burden on the municipality but frequently also a defective supply in the higher portions of the distribution. The employment of a regular waste-detection staff has in most cases been found to make for economy and efficiency.

Drainage.

37. Drainage schemes, on modern lines, are the basis of all sanitary improvement in urban areas. The demand for them is scarcely less than that for piped water and is steadily on the increase. And in the case of water-supply complete figures are not available but the known expenditure during the last twenty years has been considerable and is now rapidly increasing. The expenditure on completed works outside the presidency towns and Rangoon during that period amounted to Rs. 97,65,049 (£65],003) whereas the cost of the works under construction is estimated at Rs. 1,54,20,502 (£1,028,033). In the beginning precedence over drainage was given to piped water-supply but experience has demonstrated the advantage of introducing both concurrently. Without drainage there is no means of carrying off the surplus water and without piped water-supply it is difficult to flush the drains properly.

38. When drainage schemes on modern lines were first started in this country there seems to have been a bias against the use of sewers and, wherever possible, open drains were adopted. Experience has shown that the preference for the open drain, and the fear that sewers would give excessive trouble, were not well-founded. On the contrary, much of the advantage of a drainage system is lost if only open drains are used, as the old system of hand-carriage latrines has to be continued. Moreover, economy in establishment is possible only in the case of a sewerage system.

Epidemic diseases.

39. The Government of India desire to invite the attention of local Governments to the importance of providing adequate facilities for the isolation of cases of epidemic diseases. The isolation of individuals suffering from infectious diseases is often desirable and sometimes necessary, and it would seem desirable to have in every important municipality a small well-built segregation hospital in charge of a qualified medical practitioner, who might be one of the medical registrars for vital statistics.

A revised set of regulations under the Indian Ports Act for the prevention of the spread of infectious and contagious diseases is under consideration.

Pilgrim centres and pilgrimages.

40. Pilgrimages necessitating as they do the collection of large numbers of persons, often more than a million, at one place at one time have an important sanitary aspect mainly in connection with cholera (*vide* paragraph 25) and other communicable diseases. The Government of India recently decided to examine the sanitary arrangements at the chief places of pilgrimage throughout India and local Governments were asked to appoint provincial committees for this purpose under the presidency of the Sanitary Commissioner with the Government of India with a view to formulate practical schemes of improvement. The inquiry is still in progress but the Government of India have already made a grant of Rs. 2 lakhs (£13,333) and promised an additional grant of 4 lakhs of rupees (£26,666) spread over four years towards the improvement of the pilgrim route to Badrinath; and they have made a further

recurring grant of Rs. 20,000 (£1,333) a year for the same object. The important question of improving the conditions of the pilgrimage to the Hedjaz by Indian Musulmans is undergoing close scrutiny. The Governor-General in Council anticipates that these inquiries will lead to signal sanitary improvements and promote the convenience and comfort of many millions of His Majesty's loyal Indian subjects.

Adulteration of food and drugs.

41. The adulteration of food and drugs is common and has an important bearing on public health. Provisions for dealing with adulteration of food-stuffs exist in most municipal enactments in India, but these are confined to municipal areas and are restricted in their operation. Bombay and the United Provinces have special laws dealing with the question. The Government of India have recently enquired from local Governments as to the desirability of legislation, imperial or provincial, on the subject. The question is not free from difficulty as, besides the necessity of fixing standards, a competent staff of analysts and inspectors is necessary, and for any real success the co-operation of the people is required.

Adulteration of milk.

42. The adulteration of milk is almost universal in Indian bazaars and a large proportion of the milk consumed is contaminated. In most cities, the milk-supply is in the hands of men ignorant of the elements of sanitation and addicted uncleanly practices. Moreover, the milk when stored and in transit to market is liable to contamination in several ways. On the other hand, the price of milk is already very high and the problem of improving the purity of the supply without increasing the price to such an extent as to cause hardship to the poorer classes is a difficult one.

The Lucknow sanitary conference recommended that the development of the dairy industry and the organisation of the transport and sale of milk should ordinarily precede measures of sanitary restriction; and that there should be mutual help and co-operation between sanitarians, milk dealers and the agricultural department. That department is already considering how to develop a profitable dairy animal, a measure largely dependent on suitable and regular feeding. While local authorities should clearly insist on cleanliness in the conditions under which cattle are milked and dairy produce is manufactured, stored or transported in towns, the removal of cattle so far as possible to cheap, healthy and natural surroundings outside cities is a measure greatly to be commended. The establishment of co-operative dairy farms in the United Provinces, the Central Provinces and elsewhere has so far been attended with success and should be encouraged. Attempts might well be made to induce *gwalas* to organise milk production outside cities and its transport to market on co-operative principles. Should these methods prove successful, it may be possible without raising the price to bring the milk-supply under necessary sanitary control. The Government of India commend the whole question to the early attention of local Governments. With regard to milk standards, conditions in India differ from those in Europe, and chemical standards should be fixed by persons possessing adequate local knowledge and experience, and with due regard to local conditions.

Town-planning and relief of congested areas.

43. While much has been done to provide drainage and pure water in large cities, there can be little hope of improving their sanitary condition permanently until measures are taken to relieve congested areas and to provide broader streets and buildings more open to sun and air. The constitution in 1898 of the Improvement Trust in Bombay marked a notable step in advance. By the end of 1912-1913, the Bombay Trust had incurred an expenditure of Rs. 488 lakhs (£3,253,333) towards schemes aggregating Rs. 802 lakhs (£5,346,666). Broad roads have been driven through the heart of the city, slum areas have been abolished; and dwellings provided for the accommodation of the poorer classes. The Calcutta Improvement Trust constituted in 1911 is now developing similar schemes for the improvement and development of Calcutta. Funds for these great projects have been provided mainly from local taxation and municipal contributions, supplemented in the case of each city by an imperial grant of Rs. 50 lakhs (£333,333) and, in the case of Calcutta, by a recurring grant of Rs. 1½ lakhs (£10,000) for 60 years. In other provinces, similar works have been carried out on a smaller scale in the larger towns notably in the United Provinces and at Lucknow.

There has been, as already stated, an increasing desire on the part of the well-to-do in cities to escape from their present insanitary surroundings and to obtain houses in more open positions outside city limits. In India, as in England, municipalities are confronted by the difficulty of obtaining land for town extensions except at prohibitive cost. The multiplicity of small owners in the country, and the impossibility of persuading them to co-operate render any considered and comprehensive plan of town extension impossible in the absence of some controlling and co-ordinating authority armed with powers of compulsion. In their letter of 26th July 1912, the Government of India indicated their opinion that where land on the outskirts of a town was mainly agricultural and could be acquired cheaply *en bloc* the local body would probably be well advised to purchase it outright.

44. Such a policy, however, will, for financial reasons, often be impossible on a large scale. Where the cost of acquisition is prohibitive, control may be preferable to acquisition, and in their circular letter of the 26th July 1912 the Government of India drew attention to the features of a scheme under discussion in the Bombay Presidency which has now been incorporated in a Town Planning Bill. The principal feature of this scheme is that the cost

is apportioned and recovered from the various persons and interests concerned in the shape of a development contribution calculated in proportion to the increased value which is estimated to accrue to each plot on the completion of the scheme, the tax that can be levied from any one owner being limited, as in England, to one-half of the betterment estimated to accrue. The local body remains liable for any excess cost not covered by the tax. Such a scheme involves taking powers to pool and redistribute small holdings in a form suitable for building purposes. It has the advantage of reducing capital outlay while securing for public purposes a share in the profits of the transaction. The Government of India have also invited an examination of the provisions of municipal acts for dealing with insanitary areas and have inquired whether the limitations contained in the English Housing Acts on excessive compensation in areas, which, after due inquiry, have been declared insanitary, might not be introduced in India. The first step towards improvement is to fix a standard of light and ventilation suitable to local conditions; the next is to ensure that adequate building regulations providing for this standard are introduced by all municipal bodies and that a competent executive staff is appointed with full powers to carry them out. The whole question will be reviewed when the replies of local Governments have been received.

Rural sanitation.

45. The difficulties which surround rural sanitation in India are well-known and persistent. Contaminated sites, polluted water-supply, badly constructed and insanitary dwellings, the habits and prejudices of the people raise obstacles to progress which in most provinces are still well-nigh insuperable. The Government of India have informed local Governments that they are at liberty to expend a portion of the imperial grants for urban sanitation on rural sanitation, provided practical schemes for this purpose are forthcoming; but they have postponed special imperial grants for this purpose until such schemes are more generally advanced. They fully appreciate the enormous importance of rural sanitation in a country which is mainly agricultural. Past experience and present conditions, however, indicate that the subject is still one for experiment on lines conceived to attract the co-operation of the people. Without their cordial help no sanitary staff could effectually deal with the village sanitation of the two hundred and twenty millions who inhabit rural areas in British India. The danger of employing low-paid and imperfectly trained subordinates in a matter so closely affecting village-life is now generally recognized and should never be out of mind.

46. The following observations are based on practical experience of rural sanitation:—

(*a*) Travelling dispensaries may be used to spread a knowledge of the simple facts regarding the more common diseases. For this purpose the sub-assistant surgeons in charge should be given a special training in hygiene. Once they become known to the people as healers of the sick their advise as sanitarians may become more acceptable.

(*b*) The improvement of the village water-supply is as important as it is difficult. Apparently, excellent results have been obtained by disinfection of wells with permanganate of potash. Experiments are being made in different parts of India in the use of tube-wells, etc. It might serve as an useful object lesson to use pumps and tube-wells for the provision of water at fairs, schools, hospitals and local public offices. In some localities, a tank supply alone is possible and the difficulty is to protect even new tanks from pollution.

(*c*) In several provinces, notably in Madras, village unions, or circles, have been formed and their committees entrusted with small grants for the improvement of the sanitation of the village site. This measure might be extended experimentally elsewhere. It is calculated to encourage discussion and inquiry regarding sanitary work.

(*d*) Village midwives are, in some districts, encouraged by small grants of money and rewards to attend at the headquarters hospital for a short and simple course of training. These measures open up possibilities with reference to a reduction in infantile mortality and children's diseases generally.

(*e*) In most districts in India, the civil surgeon is also in theory the sanitary officer of the district. His duties at headquarters, however, do not allow him to tour and inspect in the district to the extent that is necessary: even in the case of epidemics in the district it is sometimes not possible for him to leave headquarters. In some provinces, district sanitary officers have been appointed and there can be little doubt that many more such appointments are required and that one of the most urgent and hopeful measures for promoting rural sanitation is the appointment of well-qualified and whole-time district health officers to control and organise all sanitary arrangements and experiments in the district.

Need for education.

47. The diffusion of sound education will, however, remain the most potent and penetrating instrument of sanitation among a population which still views it for the most part with hostility, or unconcern. The claims of hygiene as part of their educational policy were recognized by the Government of India in their educational resolution of the 21st February 1913. It may be hoped that before many years have passed educational institutions will have

become missions of sanitation in their own vicinity and beyond. Meanwhile, some simple knowledge of the more common infectious diseases may with advantage be diffused. The difficulties are considerable and systematic organisation is required. The Indian branch of the St. John Ambulance Association has offered its valuable assistance. In several provinces, pictorial leaflets are distributed and simple lantern lectures and demonstrations are given at fairs and other large gatherings, while in Bombay popular lectures to teachers, students and others have been organised by Major Glen Liston. The Indian Research Fund Association has decided to establish a central bureau where lanterns and lantern slides, pictures, and skeleton lectures can be stocked for issue on loan. Much may be done by utilising the services of municipal health officers and medical subordinates attached to travelling dispensaries and by enlisting the sympathies and active help of medical women, private medical practitioners, and private philanthropic agencies and persons. Sanitation must begin at home and as the Hon'ble Sir Pardey Lukis and Colonel Firth, the former on the civil, the latter on the military side, have pointed out, there will never be any real advance in domestic or personal hygiene until the women of the country realise its advantages and necessity. The encouragement of medical women to preach the gospel of health inside the zenana and to organise purdah parties for simple lantern demonstration lectures and the employment of nurse visitors as in Delhi, Calcutta, Madras and Bombay, are to be commended. Periodical local conferences and publications similar to that recently issued by the Bombay Government entitled "Some recent sanitary developments in the Bombay Presidency" are very useful and keep the question of sanitation before the public mind. Other methods for preparing people to combat preventible disease and premature mortality may suggest themselves. There is room for many workers in the sanitary field. The Governor-General in Council appeals with confidence to all who have interest in the well-being of India to join with him and the local Governments in a sustained endeavour to give effect to His Imperial Majesty's most gracious wish that the homes of his Indian subjects may be brightened and their labour sweetened by the spread of knowledge with all that follows in its train, a higher level of thought, of comfort and of health.

No. 787]

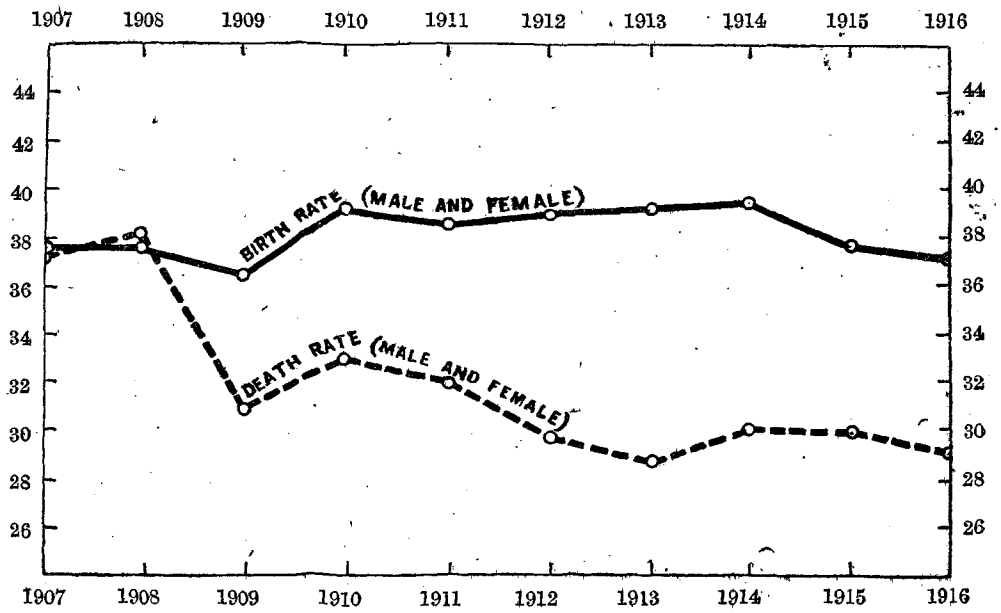
(1) BIRTHS AND DEATHS

Birth rate and Death rate per 1,000 of population in British India

(Based on Table Nos. 2, 3 and 4, pages 3—7)

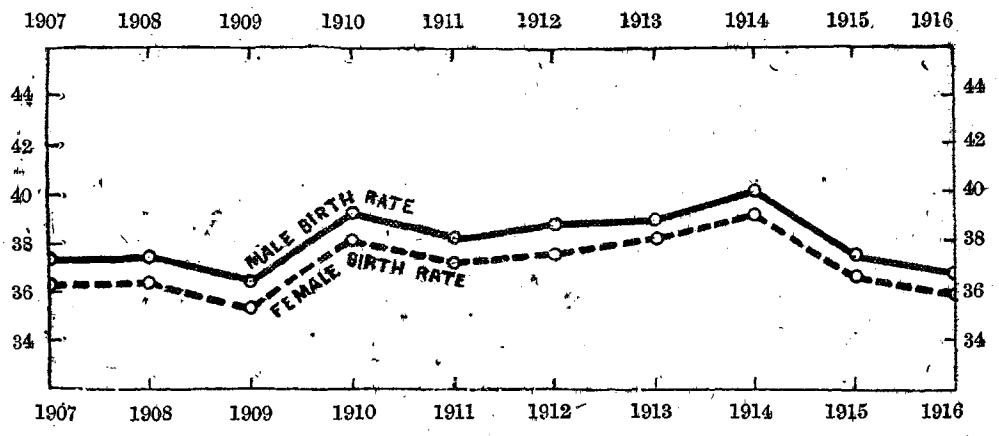
I

BIRTHS AND DEATHS



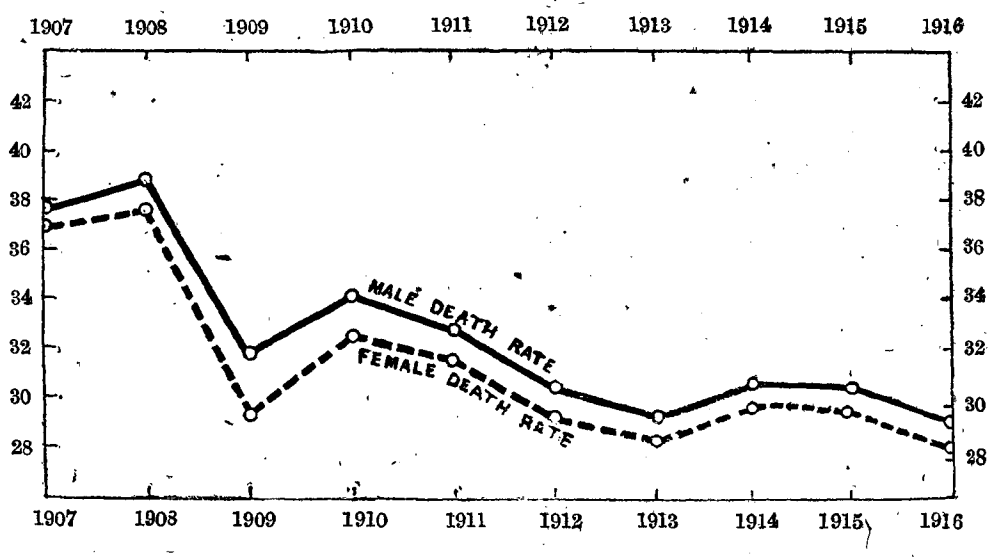
II

BIRTHS



III

DEATHS

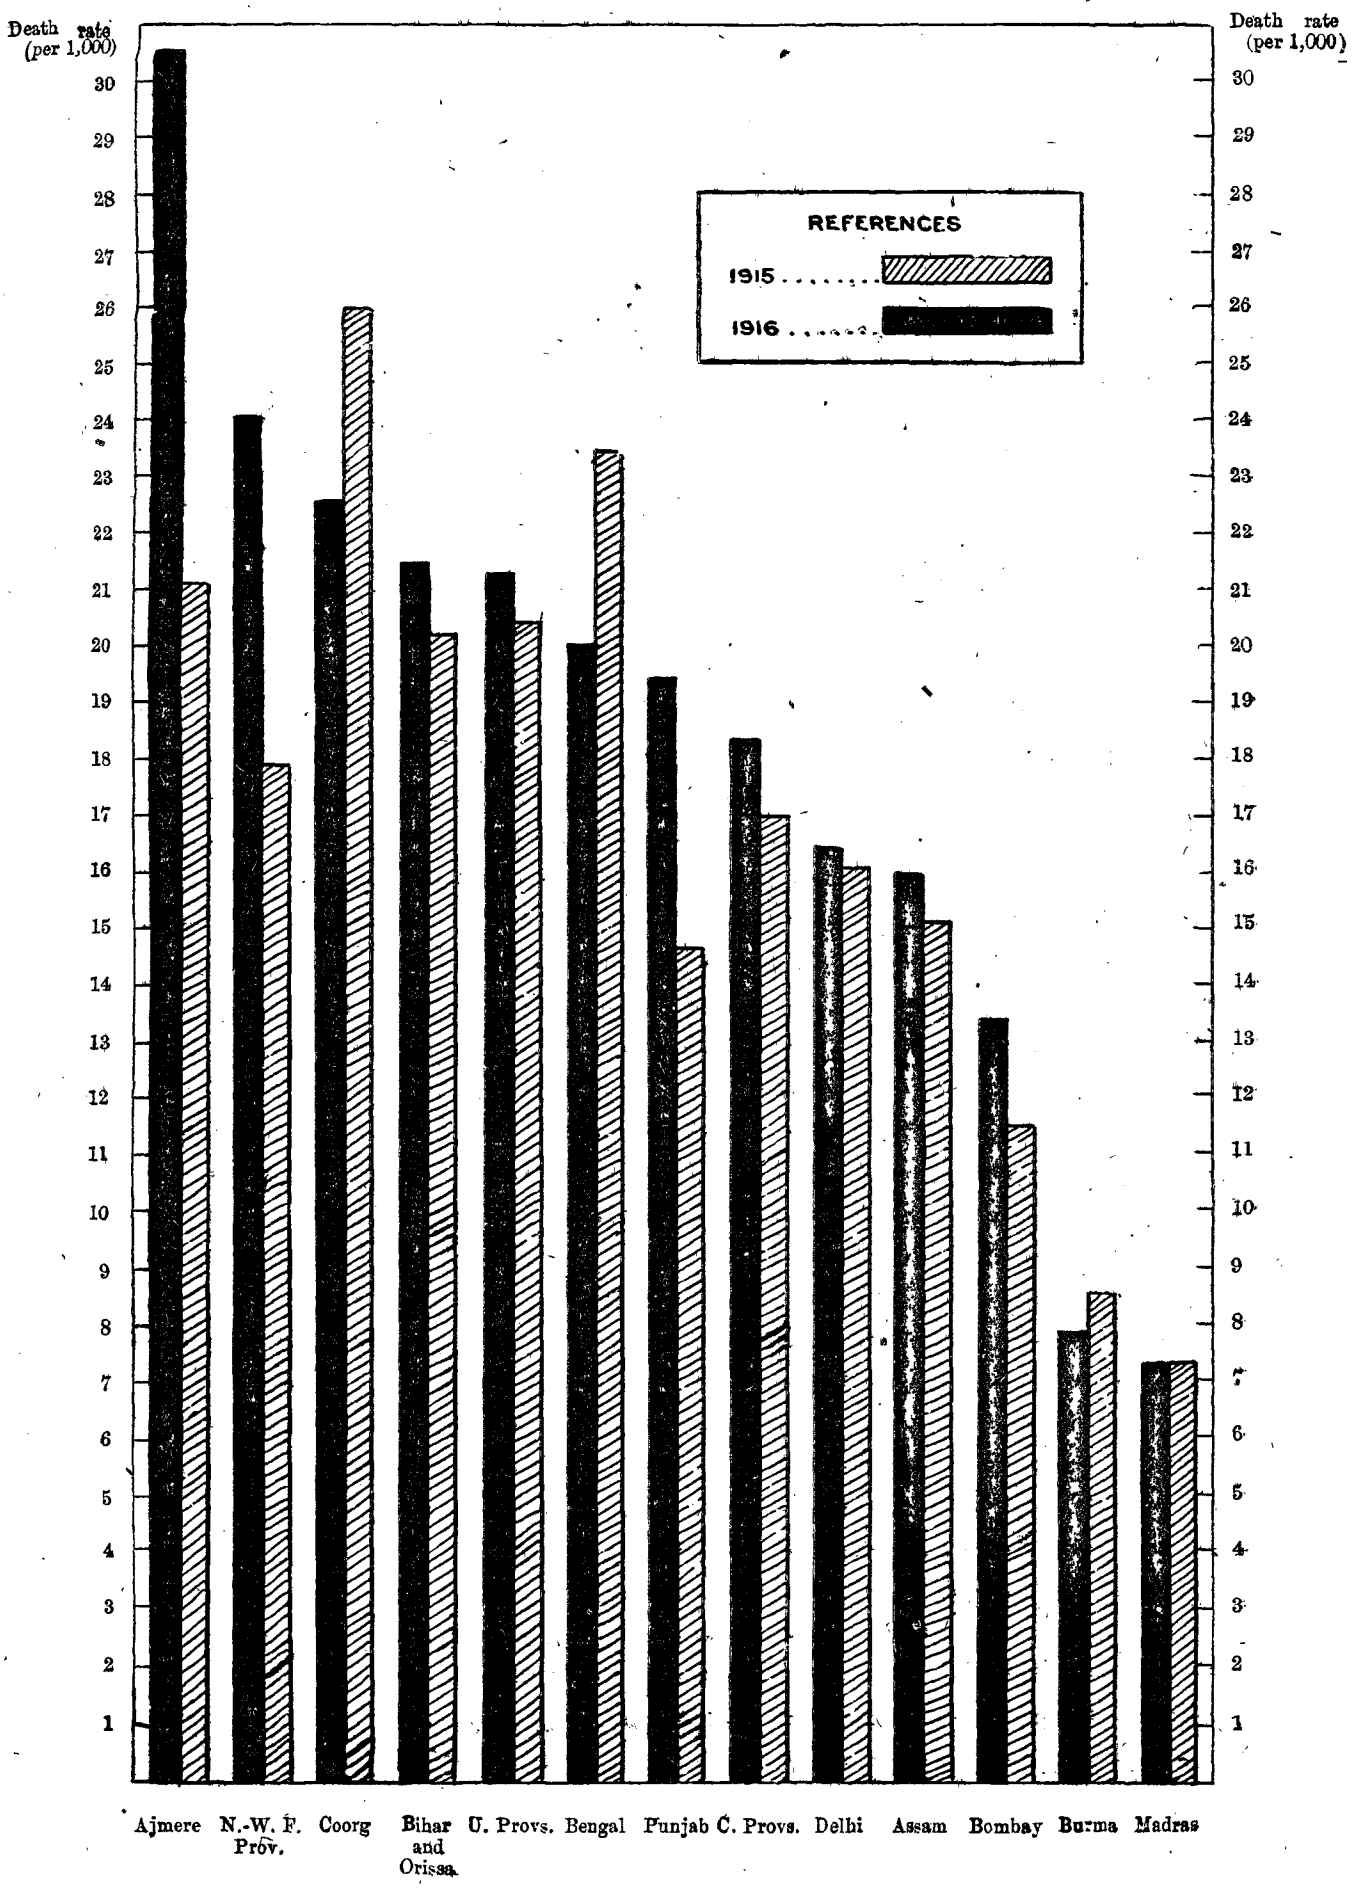


NOTE.—The deaths in 1908 were high, 8,653,007, as compared with the average of the previous five years 7,900,633, an increase of 9·5 per cent. The greater percentage of these deaths in 1908 was due to fevers, 62·7 per cent, and cholera 6·8 per cent. The mortality in the United Proviuces and Madras was exceptionally high.

(2) MORTALITY FROM "FEVERS"

Ratio of deaths from "fevers" per 1,000 of population in each province of British India in 1916, as compared with the previous year.

(Based on table No. 12, pages, 26-27.)

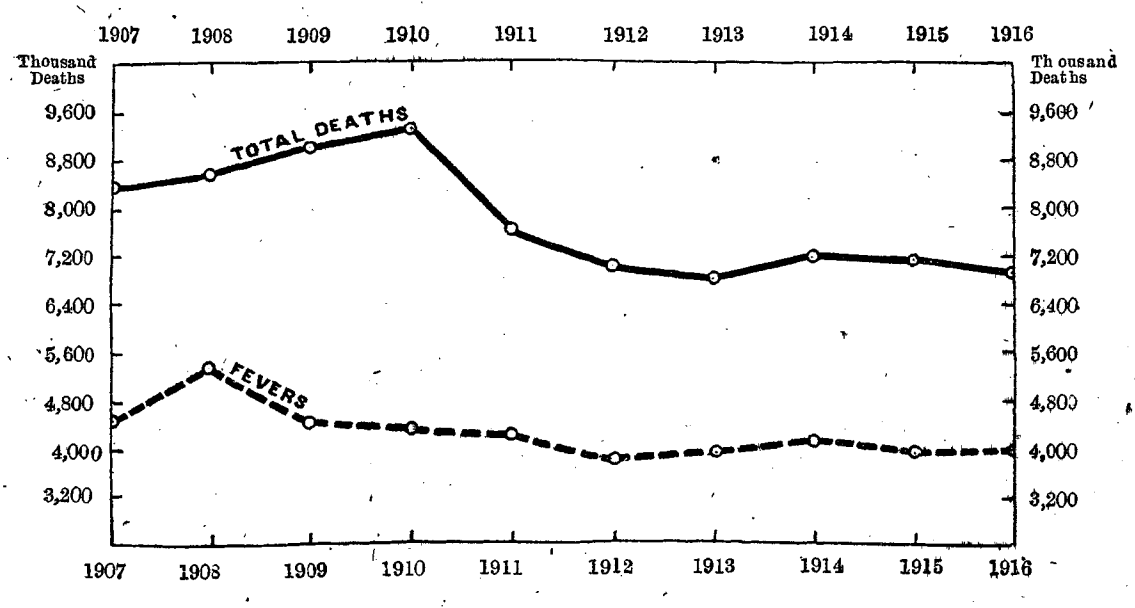


(3) MORTALITY FROM PRINCIPAL DISEASES

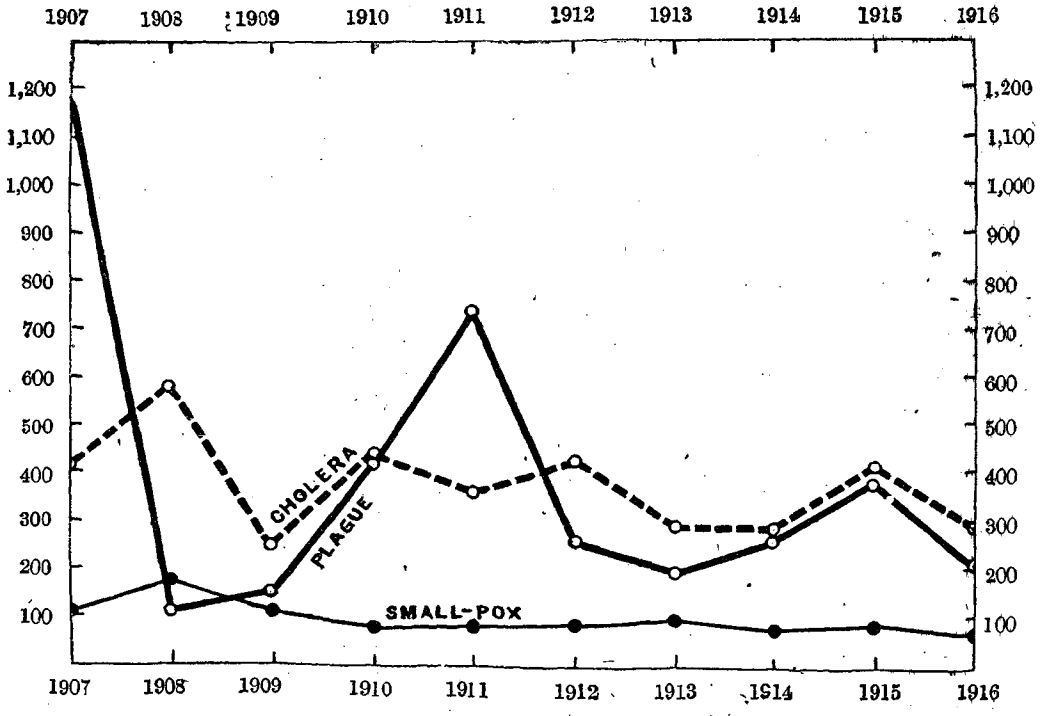
Deaths from principal diseases in British India

(Based on Table No. 11, page 25)

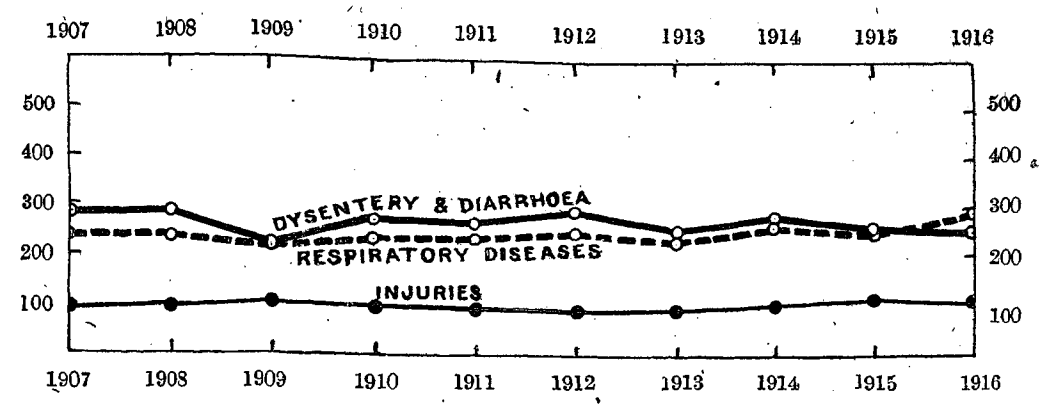
I



II



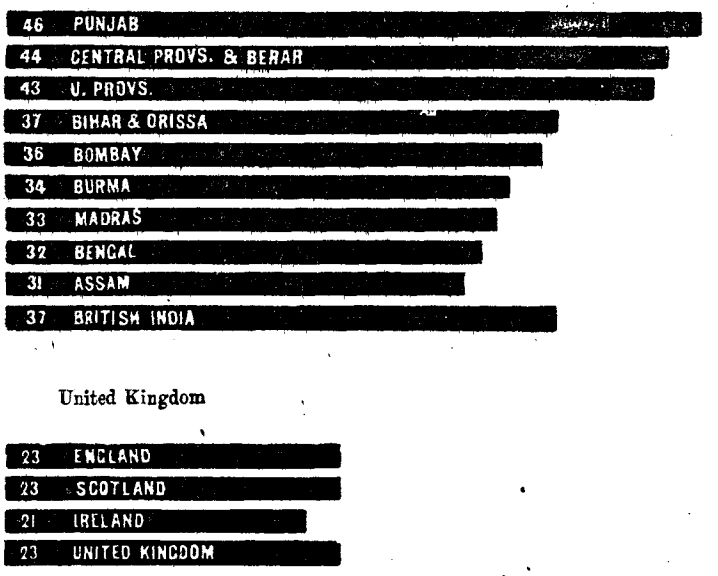
III



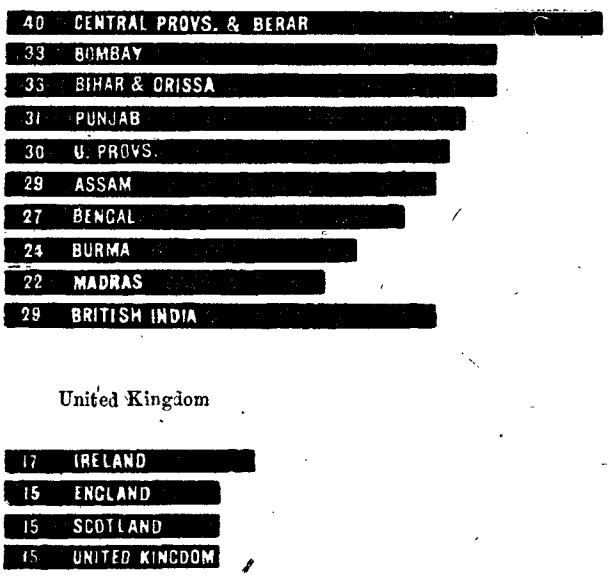
NOTE.—Each division in chart (I) represents 800,000, as against 100,000 in charts (II) and (III)

(4) Ratio of births, deaths and infantile mortality in the major provinces of British India in 1916, as compared with those in the United Kingdom.

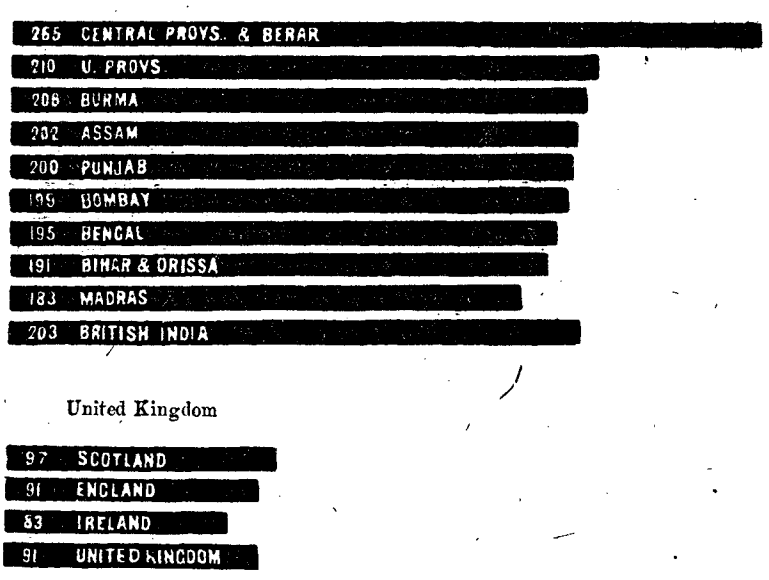
(a) Birth rate per 1,000 of population



(b) Death rate per 1,000 of population



(c) Ratio of Infantile mortality per 1,000 of population



Births

Province	Actual number of births
1 United Provinces	2,017,756
2 Bengal	1,445,592
3 Madras	1,301,597
4 Bihar and Orissa	1,263,837
5 Punjab	881,546
6 Bombay	704,672
7 Central Provinces and Berar	610,237
8 Burma	332,227
9 Assam	184,739
Total British India	8,856,233
1 England and Wales	785,520
2 Scotland	109,935
3 Ireland	91,437
United Kingdom	986,892

Deaths

Province	Actual number of deaths
1 United Provinces	1,381,299
2 Bengal	1,241,021

Infantile Mortality

Province	Actual number of Infantile mortality
1 United Provinces	423,130
2 Bengal	282,407
3 Bihar and Orissa	241,114
4 Madras	237,893
5 Punjab	176,496
6 Central Provinces and Berar	161,916
7 Bombay	140,632
8 Burma	68,552
9 Assam	37,318
Total British India	1,793,734
1 England and Wales	*
2 Scotland	*
3 Ireland	*
United Kingdom	*

* Actual numbers regarding infantile mortality in the United Kingdom are not available

NOTE.—The ratio of infantile mortality in British India is more than double that of the United Kingdom. At the same time it should be remembered that the birth rate is also nearly double

To

THE SECRETARY TO THE GOVERNMENT OF INDIA,
DEPARTMENT OF EDUCATION.

SIR,

I have the honour to submit the Public Health Volume (Volume III) of the Statistics of British India, 9th Issue. This volume deals with statistics relating to Births and Deaths, Hospitals, Lunatic Asylums, Vaccination, and Deaths from wild animals and snakes. Four charts, showing (i) the Indian birth and death rates for a series of years, (ii) mortality from "fevers," in each province, (iii) mortality from principal diseases in British India, and (iv) birth rate, death rate and infantile mortality in each province, have been added, with a full index for ready reference.

2. For a descriptive account of these statistics a reference is invited to the Report of the Sanitary Commissioner with the Government of India for 1916, and to the Resolution of the Government of India in the Home Department on the destruction of wild animals and snakes, No. 1100, dated the 5th August 1918.

I have the honour to be,

Sir,

Your most obedient servant,

G. FINDLAY SHIRRAS,
Director of Statistics.

DEPARTMENT OF STATISTICS, INDIA,
No. 1, COUNCIL HOUSE STREET,
Calcutta, 21st December 1918.

GENERAL CONTENTS

	Pages.
CHARTS—	
(1) Birth and Death rates in British India	Frontis-piece.
(2) Mortality rates from "Fevers" in each Province of British India	"
(3) Mortality from Principal Diseases in British India	"
(4) Birth rate, Death rate, and Infantile mortality in each province	"

Summary Table	1 Summary of Principal Tables	1—2
	2 Births and Deaths in British India, from 1907 to 1916	3
	3 Number, and Ratio to Population, of Births from 1907 to 1916	4—5
	4 Number, and Ratio to Population, of Deaths from 1907 to 1916	6—7
	5 Number, and Ratio to Population, of Deaths in Towns and in Rural Circles from 1907 to 1916	8—9
	6 Ratio of Deaths in certain large Cities and Stations from 1907 to 1916	10—11
Vital Statistics	7 Number of Deaths according to Age from 1907 to 1916	12—15
	8 Ratio to Population of Deaths according to Age from 1907 to 1916	16—19
	9 Number of Deaths according to Class from 1907 to 1916	20—21
	10 Ratio to Population of Deaths according to Class from 1907 to 1916	22—23
	11 Number of Deaths according to Cause from 1907 to 1916	24—25
	12 Ratio to Population of Deaths according to Cause from 1907 to 1916	26—27
	13 Number of Deaths from all Causes in each Month from 1907 to 1916	28—31
	14 Ratio to Population of Deaths from all Causes in each Month from 1907 to 1916	32—33
Hospitals	15 Number of State-Public, Local Fund, and Private-aided Hospitals and Dispensaries; Number of Indoor and Outdoor Patients treated in them; also their Income and Expenditure; from 1907 to 1916	34
	16 Number and Classification of State-Public, Local Fund, and Private-aided Hospitals and Dispensaries, and Number of Indoor and Outdoor Patients treated in them, from 1912 to 1916	35—41
	16(i) Number and Classification of the Hospitals and Dispensaries for Females, and Number of Indoor and Outdoor Patients treated in them, from 1912 to 1916	42—45
	17 Number of Cases, under each Principal Class of Disease, treated in the State-Public, Local Fund, and Private-Aided Hospitals and Dispensaries, from 1912 to 1916	46—53
	17(i) Diseases of Outdoor Patients treated in State-Public, Local Fund, and Private-Aided Hospitals and Dispensaries from 1912 to 1916	54—57
	18 Income of State-Public, Local Fund, and Private-aided Hospitals and Dispensaries from 1912 to 1916	58—59
	19 Expenditure of State-Public, Local Fund, and Private-aided Hospitals and Dispensaries from 1912 to 1916	60—63
	20 Number and Classification of State-Special and Railway Hospitals and Dispensaries, and Number of Indoor Patients treated in them, from 1912 to 1916; also the Principal Diseases for which the Patients were treated	64—71
	20(i) Diseases of Outdoor Patients treated in State-Special and Railway Hospitals and Dispensaries from 1912 to 1916	72—75
	21 Number and Classification of Private non-aided Hospitals and Dispensaries, and Number of Indoor and Outdoor Patients treated in them, from 1912 to 1916; also the Principal Diseases for which the Patients were treated	76—83
Lunatic Asylums	22 Number of Lunatics (with their Previous Occupations and Religion) admitted into the Asylums from 1907 to 1916; also the Types and Ætiological factors of Insanity treated in those years	84
	23 Number of Lunatics admitted into, discharged from, and remaining in Asylums, from 1912 to 1916	85—88
	24 Religion of Patients admitted into Asylums from 1912 to 1916	89
	25 Number of Criminal Lunatics in Asylums from 1912 to 1916	90—91
	26 Previous Occupation of Lunatics admitted into Asylums from 1912 to 1916	92—93
	27 Types of Insanity of the Lunatics in Asylums from 1912 to 1916	94—95
	28 Ætiological Factors and Associated conditions in the patients admitted into the Asylums in 1912 to 1916	96
	29 Income and Expenditure of Asylums from 1912 to 1916	97—99
Vaccination	30 Abstract Statement of all Vaccination Operations, Cost of the Special Vaccination Department, and Cost of each Successful Case, from 1907-08 to 1916-17	100
	31 Number of primary and re-vaccinations and of successful cases in British India in the official years, 1912-13 to 1916-17	101
	32 Number of Persons Vaccinated by the Special Vaccination Establishment, from 1912-13 to 1916-17	102
	33 Details of the Special Vaccination Establishment from 1912-13 to 1916-17	103

	Table No.	Pages
Vaccination	34 Proportion of Successful Cases in Primary Vaccinations and re-Vaccinations effected by the Special Vaccination Establishment from 1912-13 to 1916-17 ..	104
	35 Cost of the Special Vaccination Establishment, Cost of each Successful Case, and Sources from which the Expenses were paid, from 1912-13 to 1916-17..	105—106
	36 Vaccinations effected by the Dispensary Establishment from 1912-13 to 1916-17 .	107
	37 Total Vaccinations effected by the Special Vaccination and Dispensary Establishments (combined) from 1912-13 to 1916-17	108
	38 Vaccinations Successfuly effected by the Special Vaccination and Dispensary Establishments (combined), and the estimated Births, from 1912-13 to 1916-17 ..	109
Deaths from and destruction of wild animals.	39 Number of Persons Killed by Wild Animals from 1908 to 1917	110
	40 Number of Persons killed by Wild Animals (specifying the principal kinds) from 1913 to 1917	111
	41 Number of Wild Animals Destroyed from 1913 to 1917	112
	42 Expenditure on Rewards for the Destruction of wild Animals, from 1913 to 1917	113
	43 Number of Licenses issued under Indian Arms Act, for the Destruction of Wild Animals or Protection of Crops, from 1913 to 1917	114

NOTE.—These figures include criminal lunatics, table No. 25

(a) Including 287 patients (males 206 and females 81) transferred from Colaba and Poona Asylums to the Central Asylum, Yeravda

(b) The actual figure representing the total population of the Asylum is 1,450 (males 1,170 and females 280). The difference between this figure and 1,737 shown in the table is due to 287 patients transferred from Colaba and Poona Asylums to the Central Lunatic Asylum, Yeravda, having been taken into account in the Provincial report both under Colaba and Poona and Central Lunatic Asylums, Yeravda

(c) Inclusive of two patients received by transfer from one Asylum to another

(d) Inclusive of five observation cases found sane

(e) Inclusive of one male patient received by transfer from Berhampur Central Lunatic Asylum

(f) Inclusive of two male patients received by transfer from the Dacca and one from the Lahore Lunatic Asylums.

(g) Inclusive of two observation cases found sane.

(h) Includes three cases of observation found sane, and discharged and also one observation case who committed suicide by hanging.

NOTE.—The difference between the number of operations and the number of persons vaccinated shown in Table No. 32 is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations but not to the number of persons vaccinated

(*a*) Excludes 1,867 operations performed in Tea Gardens in Jalpaiguri, the details being not available

(*b*) Includes re-vaccinations

No. 35.—COST (in rupees) of the SPECIAL VACCINATION ESTABLISHMENT in BRITISH INDIA, COST of each SUCCESSFUL CASE, and the SOURCES from which the EXPENSES were paid

NOTE (1)—The difference between the number of operations and the number of persons vaccinated is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations, but not to the number of persons vaccinated

(2)—No vaccination is performed by the Dispensary Establishment in Delhi and Ajmer-Merwara

(a) In Bengal the statistics show particulars of vaccination performed by vaccinators attached to Municipalities, Jails, Cantonments, and Railways, etc. The number of such vaccinators during 1912-13, 1913-14, 1914-15, 1915-16 and 1916-17 were 132, 129, 143, 163 and 159 respectively. The average number of persons vaccinated by each vaccinator in those years being 708, 701, 840 698 and 634 respectively. In other provinces the statistics relate to vaccinations performed by Civil Surgeons or medical subordinates attached to dispensaries as there are no special vaccinators attached to them

(b) Includes re-vaccinations

No. 37.—TOTAL VACCINATIONS effected by the SPECIAL VACCINATION and DISPENSARY ESTABLISHMENTS (combined) in BRITISH INDIA

Province		Total number successfully vaccinated			Ratio of successful vaccinations per 1,000 of population (*b*)	Annual average of successful vaccinations performed by the Department during the five years previous to each year entered in this table		Average annual deaths from Smallpox during the five years previous to each year entered in this table

No. 939]

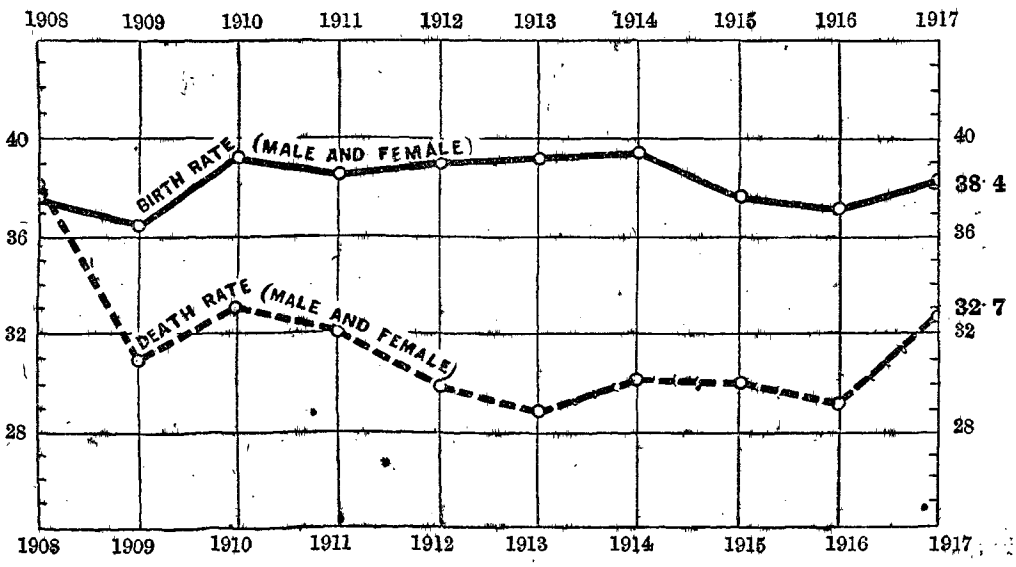
(1) Births and Deaths

Birth rate and Death rate per 1,000 of population in British India

(Based on Table Nos. 2, 3 and 4, pages 3—7)

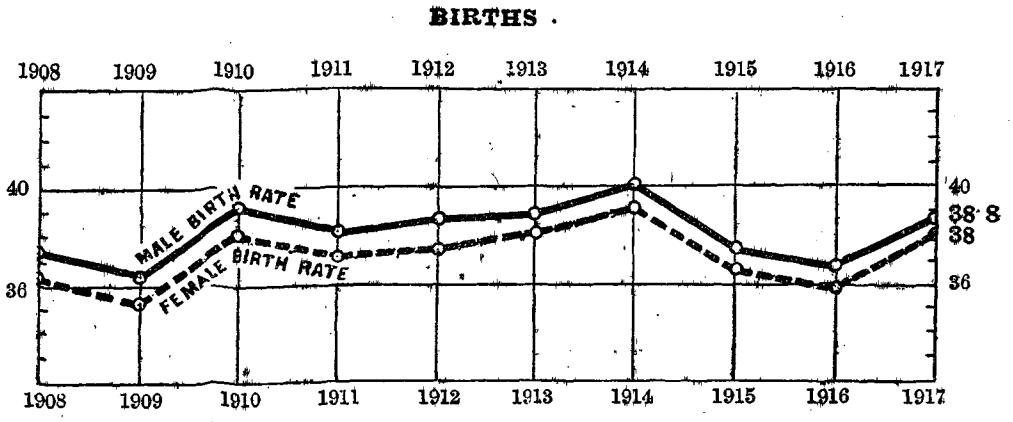
I

BIRTHS AND DEATHS



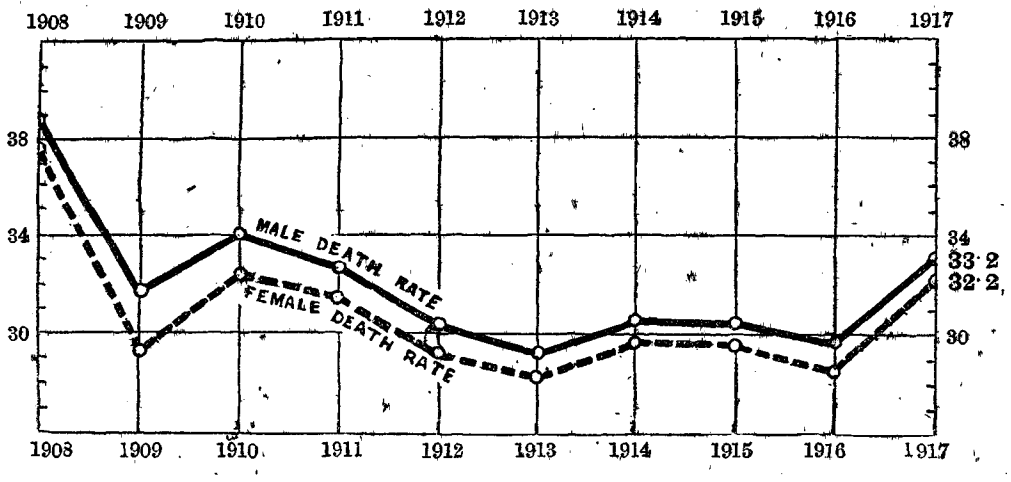
II

BIRTHS .



III

DEATHS

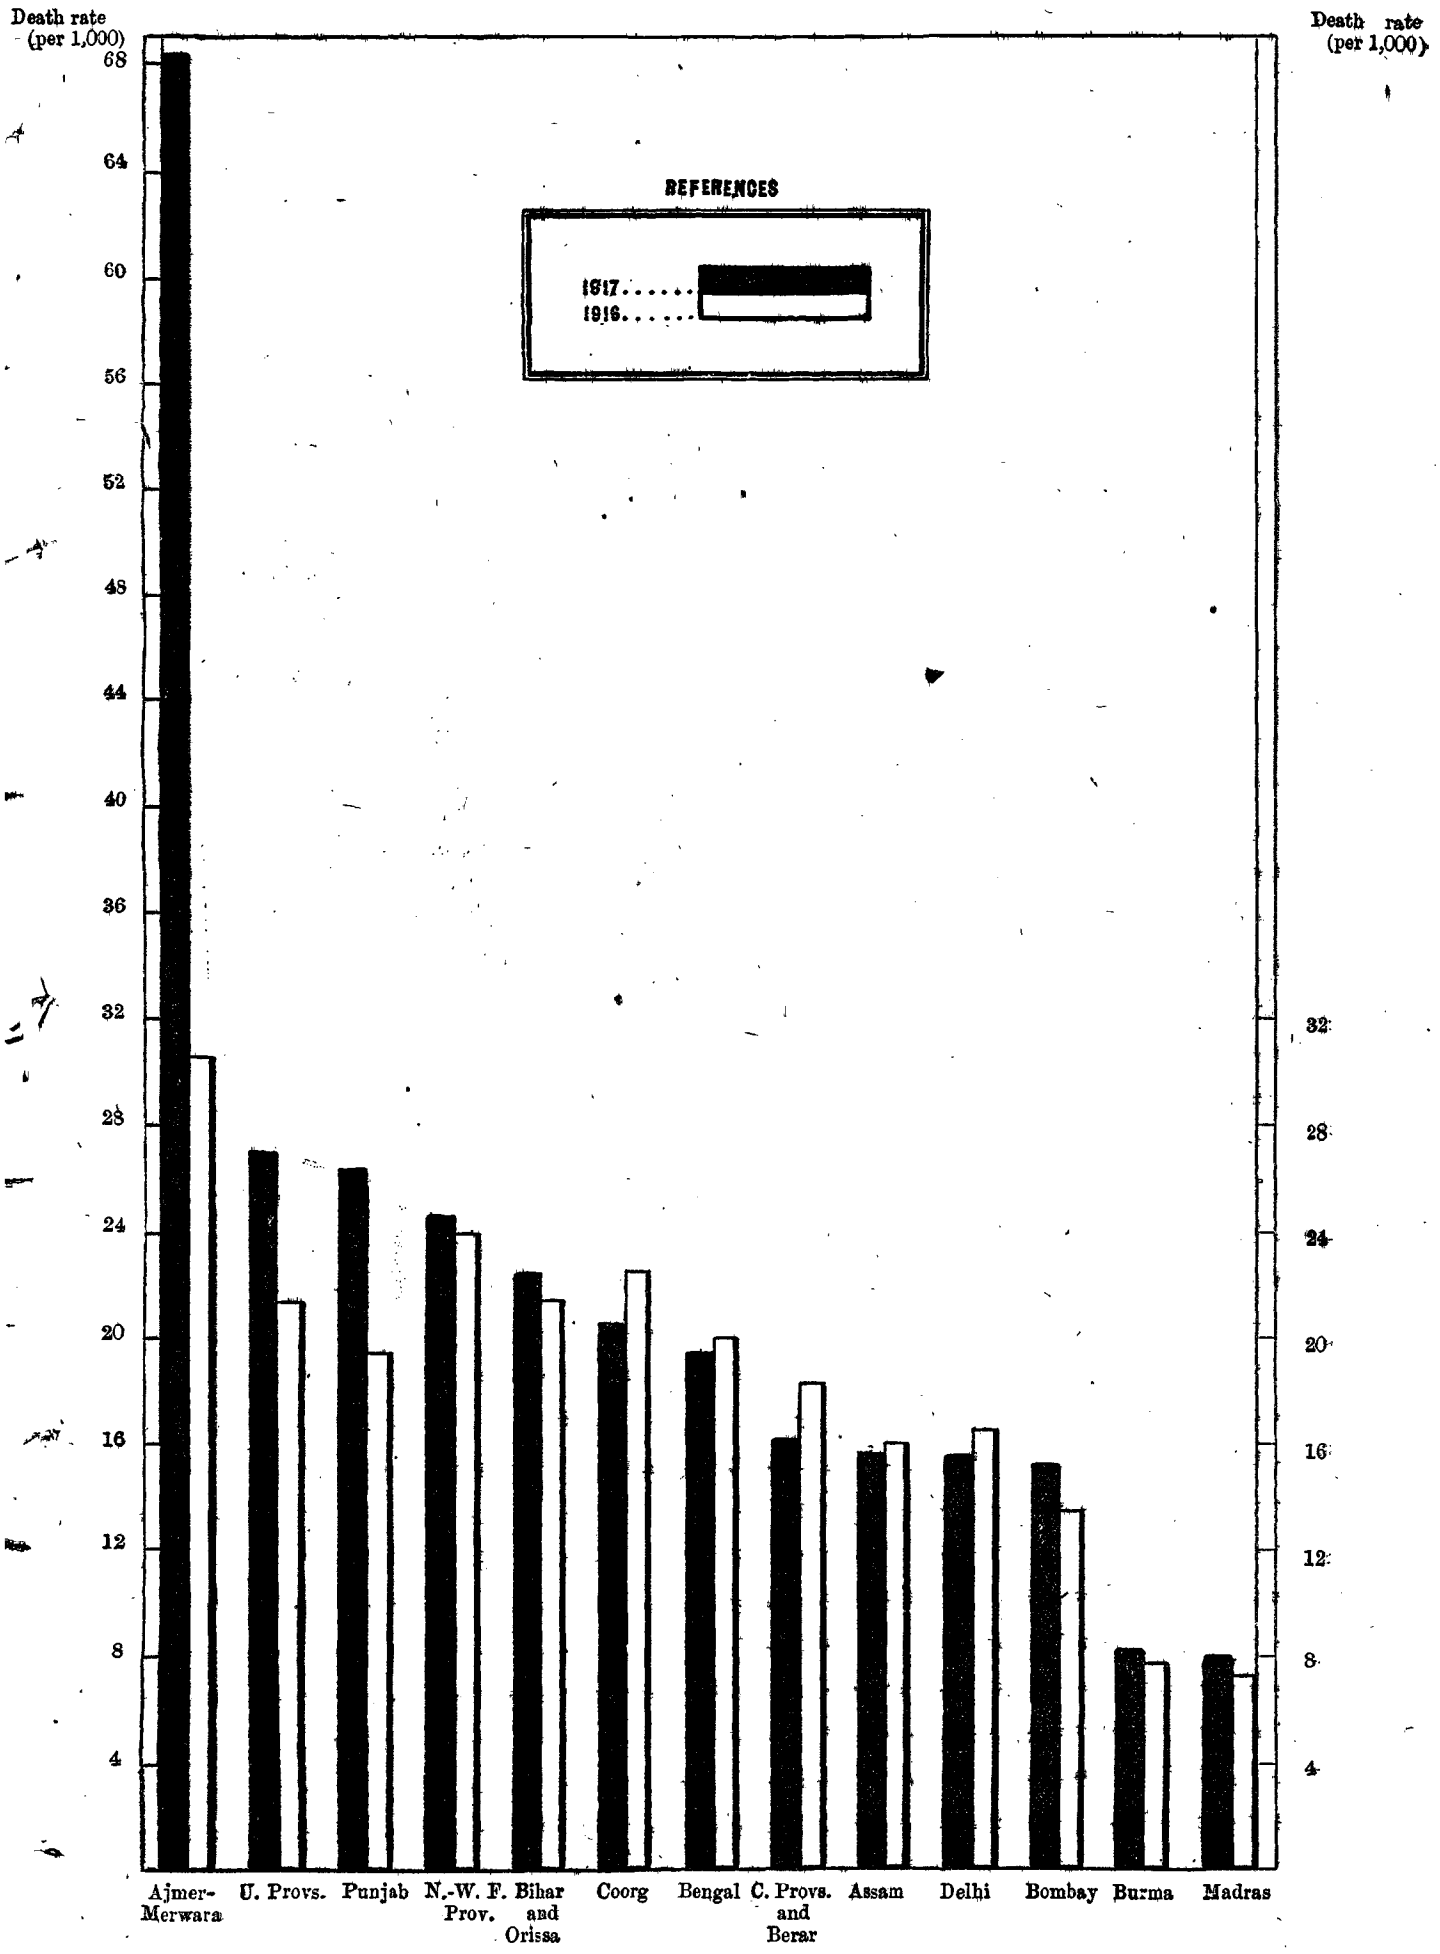


NOTE.—The deaths in 1908 were high, 8,653,007, as compared with the average of the previous five years, 7,900,633, an increase of 9·5 per cent. The greater percentage of these deaths in 1908 was due to fevers, 62·7 per cent, and cholera 6·8 per cent. The mortality in the United Provinces and Madras was exceptionally high.

(2) Mortality from "fevers"

Ratio of deaths from "fevers" per 1,000 of population in each province of British India in 1917, as compared with the previous year.

(Based on table No. 12, pages 26-27.)

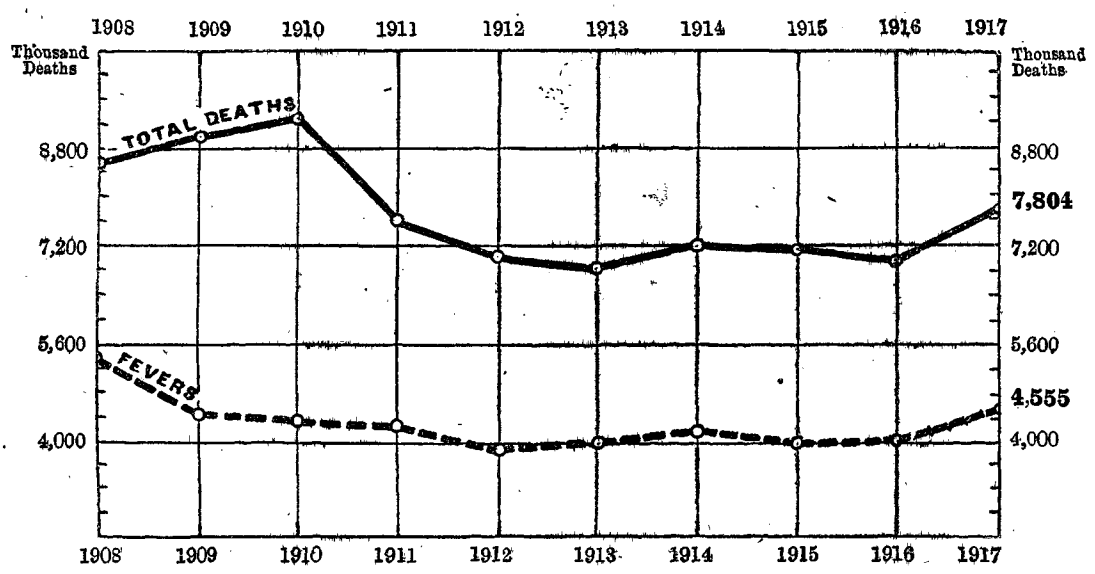


(3) Mortality from principal diseases

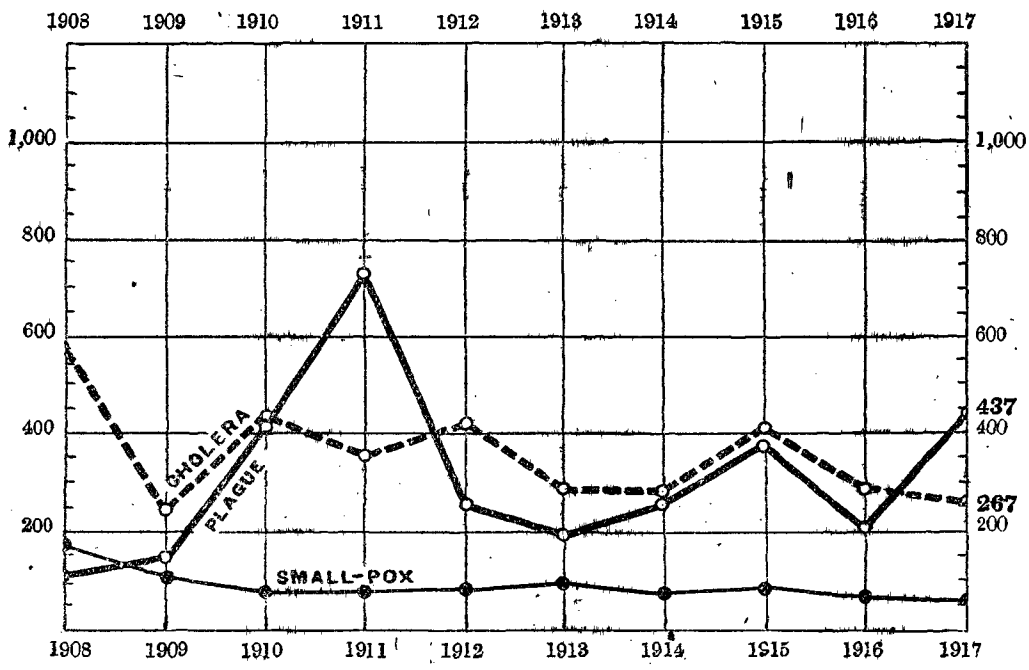
Deaths from principal diseases in British India

(Based on Table No. 11, page 25)

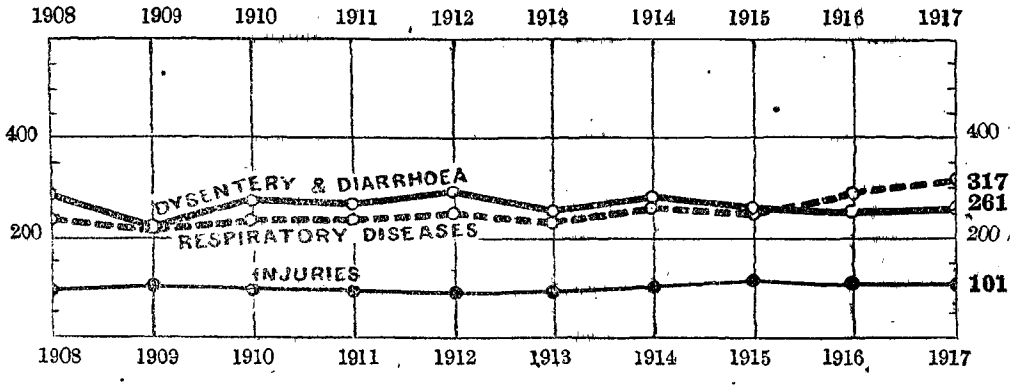
I



II



III



NOTE.—Each division in chart (I) represents 1,600,000, as against 200,000 in chart (II) and (III)

(4) Ratio of births, deaths and infantile mortality in the major provinces of British India in 1917, as compared with those in the United Kingdom.

8 Burma	75,907
9 Assam	35,914
Total British India	1,929,491
1 England and Wales	*
2 Scotland	*
3 Ireland	*
Total United Kingdom	*

* Actual numbers regarding infantile mortality in the United Kingdom are not available

To

THE SECRETARY TO THE GOVERNMENT OF INDIA,
DEPARTMENT OF EDUCATION.

SIR,

I have the honour to submit the Public Health Volume (Volume III) of the Statistics of British India, 10th Issue. This volume deals with statistics relating to Births and Deaths, Hospitals, Lunatic Asylums, Vaccination, and Deaths from wild animals and snakes. Four charts, showing (i) the Indian birth and death rates for a series of years, (ii) mortality from "fevers," in each province, (iii) mortality from principal diseases in British India, and (iv) birth rate, death rate, and infantile mortality in each province, have been added, with a full index for ready reference.

2. For a descriptive account of these statistics a reference is invited to the Report of the Sanitary Commissioner with the Government of India for 1917, and to the Resolution of the Government of India in the Home Department on the destruction of wild animals and snakes, No. 1100, dated the 5th August 1918.

I have the honour to be,

Sir,

Your most obedient servant,

G. FINDLAY SHIRRAS,
Director of Statistics.

DEPARTMENT OF STATISTICS, INDIA,
No. 1, COUNCIL HOUSE STREET,
Calcutta, 11th June 1919.

No. 15—ESTIMATED NUMBER OF DEATHS from INFLUENZA and DEATH RATE per mille of POPULATION in 1918

Province	Population (Census 1911)	Total estimated influenza deaths	Influenza death rate per thousand
Bengal	45,329,247	213,098	4·7
Madras	40,005,735	509,667	12·7
Bombay	19,587,383	900,000	45·9
United Provinces	46,820,506	1,072,671	22·9
Bihar and Orissa	34,489,846	359,482	10·3
Punjab	19,337,146	816,317	42·2
Delhi	416,656	23,175	55·6
Burma	9,855,853	60,000	6·0
Central Provinces and Berar	13,916,308	790,820	56·8
Assam	6,051,507	69,113	11·4
North-West Frontier Province	2,041,077	82,000	40·0
Coorg	174,976	3,382	19·0
TOTAL FOR BRITISH INDIA*	238,026,240	4,899,725	20·6

* The small British province of Ajmer-Merwara, with a population of half a million, is not included in the table. No detailed report regarding the incidence of influenza therein has yet been received: it suffered considerably.

HOSPITALS.*

No. 16.—NUMBER of STATE-PUBLIC, LOCAL FUND, and PRIVATE-AIDED HOSPITALS and DISPENSARIES in BRITISH INDIA, NUMBER of INDOOR and OUTDOOR PATIENTS treated in them, also their INCOME and EXPENDITURE (in rupees)

NOTE.—These figures include criminal lunatics, table No. 25

(a) Including 287 patients (males 206 and females 81) transferred from Colaba and Poona Asylums to the Central Asylum, Yeravda

(b) The actual figure representing the total population of the Asylum is 1,459 (males 1,179 and females 280). The difference between this figure and 1,737 shown in the table is due to 287 patients transferred from Colaba and Poona Asylums to the Central Lunatic Asylum, Yeravda, having been taken into account in the Provincial report both under Colaba, Poona and Central Lunatic Asylums, Yeravda

(c) Inclusive of two patients received by transfer from one Asylum to another

(d) Inclusive of five observation cases found sane

(e) Inclusive of one male patient received by transfer from Berhampur Lunatic Asylum

(f) Inclusive of two male patients received by transfer from the Dacca and one from the Lahore Lunatic Asylums

(g) Inclusive of two observation cases found sane

(h) Includes three cases of observation found sane, and discharged and also one observation case who committed suicide by hanging

(i) Inclusive of seven lunatics (5 males and 2 females) received by transfer from one Asylum to another

(j) Includes one transfer from criminal to non-criminal and one from non-criminal to criminal; 6 cases of alleged Lunacy discharged sane from observation

in the ASYLUMS of BRITISH INDIA

NOTE.—The difference between the number of operations and the number of persons vaccinated shown in Table No. 32 is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations but not to the number of persons vaccinated

(a) Excludes 1,867 operations performed in Tea Gardens in Jalpaiguri, the details being not available

No. 36.—COST (in rupees) of the SPECIAL VACCINATION ESTABLISHMENT in BRITISH INDIA, COST of each SUCCESSFUL CASE, and the SOURCES from which the EXPENSES were paid

NOTE (1)—The difference between the number of operations and the number of persons vaccinated is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations, but not to the number of persons vaccinated

(2)—No vaccination is performed by the Dispensary Establishment in Delhi and Ajmer-Merwara

(*a*) In Bengal the statistics show particulars of vaccination performed by vaccinators attached to Municipalities, Jails, Cantonments, and Railways, etc. The number of such vaccinators during 1913-14, 1914-15, 1915-16, 1916-17, and 1917-18 were, 129, 143, 163, 159 and 161, respectively. The average number of persons vaccinated by each vaccinator in those years being 701, 840, 698, 634 and 676, respectively. In other provinces the statistics relate to vaccinations performed by Civil Surgeons or medical subordinates attached to dispensaries as there are no special vaccinators attached to them

No. 38.—TOTAL VACCINATIONS effected by the SPECIAL VACCINATION and DISPENSARY ESTABLISHMENTS (combined) in BRITISH INDIA

Province		Total number successfully vaccinated			Ratio of successful vaccinations per 1,000 of population (b)	Annual average of successful vaccinations performed by the Department during the five years previous to each year entered in this table		Average annual deaths from Small-pox during the five years previous to each year entered in this table

INDEX

PAGE

Aetiological factors and associated conditions in Lunatics 84, 96

Age—
- Number of deaths according to— . . . . .12—15
- Ratio of deaths per thousand of population according to— . . . . . .16—19

Beds available in hospitals and dispensaries 37, 40, 43, 45, 64, 66, 76, 78

Births—
- Excess of — over deaths . . . . . 4—5
- Number of — in different provinces . . . 4—5
- Population of the different provinces in British India in which — were registered . . . . 4—9
- Ratio of male — per thousand of population in British India 3
- Ratio of female — per thousand of population in British India 3
- Total Ratio of — per thousand of population . . 4—5

Buddhists—
- Number of deaths of — . . . . . .20—21
- Ratio of deaths of—per thousand of population 3, 22—23

Children—Number of successfully vaccinated— . 101, 104, 107, 109

Cholera—
- Mortality from— . . . . . .24—25
- Ratio of deaths per thousand of population from — 3, 26—27

Christians—
- Number of deaths of — . . . . . .20—21
- Ratio of deaths per thousand of population of — 3, 22—23

Cities—
- Population of certain large — in different provinces of British India . . . . . 10—11
- Ratio of deaths per mille in— . . . . . ib

Classification of hospitals and dispensaries—
- Private non-aided Hospitals and Dispensaries . 76—83
- State Public, Local Funds, and Private-aided hospitals and dispensaries . . . . . .35—57
- State Public, Local Funds, and Private-aided hospitals and dispensaries for females . . . . .42—45
- State Special and Railway hospitals and dispensaries . . . . . .64—75

Cost of vaccination by Special Department . 100, 105—106

Criminal Lunatics . . . . . .90—91

Deaths—
- Excess of births over— . . . . . 4—5
- Influenza 34
- Number of — according to age . . . .12—15
- Number of — according to causes . . . .24—25
- Number of — according to class . . . .20—21
- Number of — according to months . . .28—31
- Number of — in different provinces 6—9, 12—15, 20, 21, 24, 25, 28—31
- Number of — in rural circles 8, 9
- Number of — in towns . . . . . ib
- Ratio of — per thousand of population in certain large cities and stations . . . . .10—11
- Ratio of — per thousand of population according to age . . . . . .16—19
- Ratio of — per thousand of population according to class . . . . . 3, 22—23
- Ratio of—per thousand of population according to causes . . . . . 3, 26—27
- Ratio of — per thousand of population in each month . . . . . 3, 32—33
- Ratio of — per thousand of population in towns 3, 8—9

British India

PREFATORY NOTE.

Public Health Statistics.

This volume of the Statistics of British India deals with statistics relating to Births and Deaths, Hospitals, Lunatic Asylums, Vaccination, and Deaths from wild animals and snakes. Four charts showing (i) the Indian birth and death rates for a series of years, (ii) mortality from "fevers" in each province, (iii) mortality from principal diseases in British India, and (iv) birth rate, death rate, and infantile mortality in each province, have been added, with a full index for ready reference.

For a descriptive account of these statistics, a reference is invited to the Report of the Sanitary Commissioner with the Government of India for 1918, and to the Resolution of the Government of India in the Home Department on the destruction of wild animals and snakes, No. 1312, dated the 30th July 1919.

D. N. GHOSH,
Offg. *Director of Statistics.*

Central Provinces and Berar	13,916,308	924,949	66·4
Assam	6,051,507	111,340	18·6
North-West Frontier Province	2,041,077	89,035	43·6
Ajmer-Merwara	501,395	29,835	59·5
Coorg	174,976	2,014	11·5
TOTAL FOR BRITISH INDIA	238,496,222	7,089,694	29·7

NOTE—(1) This table gives an estimate by the Sanitary Commissioner with the Government of India of the mortality directly and indirectly due to Influenza. These estimated figures differ slightly from those given in the Provincial Sanitary reports.

(2) The death rates roughly divide India into two areas: South-east and North-east with a death rate under 20, and the other West, Central and North-West with a death rate of 40 or over. In the first group are included Madras, Bengal, Bihar and Orissa, Assam, and Burma; and in the second group Bombay, the Central Provinces, the United Provinces, Delhi, the Punjab, the North-West Frontier Province, and Ajmer-Merwara.

HOSPITALS.*

No. 16.—NUMBER of STATE-PUBLIC, LOCAL FUND, and PRIVATE-AIDED HOSPITALS and DISPENSARIES in BRITISH INDIA, NUMBER of INDOOR and OUTDOOR PATIENTS treated in them also their INCOME and EXPENDITURE (in rupees)

NOTE (1)—The difference between the number of operations and the number of persons vaccinated is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations, but not to the number of persons vaccinated

(2)—No vaccination is performed by the Dispensary Establishment in Delhi, Central Provinces and Ajmer-Merwara

(a) In Bengal the statistics show particulars of vaccination performed by vaccinators attached to Municipalities, Jails, Cantonments, and Railways, etc. The number of such vaccinators during 1914-15, 1915-16, 1916-17, 1917-18, and 1918-19 were 143, 163, 159, 161 and 162 respectively. The average number of persons vaccinated by each vaccinator in those years being 840, 698, 634, 676 and 999 respectively. In other provinces the statistics relate to vaccinations performed by Civil Surgeons or medical subordinates attached to dispensaries as there are no special vaccinators attached to them

No. 38.—TOTAL VACCINATIONS effected by the SPECIAL VACCINATION and DISPENSARY ESTABLISHMENTS (combined) in BRITISH INDIA

Province		Total number successfully vaccinated			Ratio of successful vaccinations per 1,000 of population (*b*)	Annual average of successful vaccinations performed by the Department during the five years previous to each year entered in this table		Average annual deaths from Small-pox during the five years previous to each year entered in this table

Aetiological factors and associated conditions in Lunatics 84, 96

Age—
- Number of deaths according to— . . . . .12—15
- Ratio of deaths per thousand of population according to— . . . . . .16—19
- Area in square mile in which deaths were registered . . . . . 6—7
- Average number vaccinated by each vaccinator . 102
- Average cost of each case successfully vaccinated . 106

Beds available in hospitals and dispensaries 37, 40, 43, 45, 64 66, 76, 78

Births—
- Excess of deaths over — . . . . . 4—5
- Excess of — over deaths . . . . . ib
- Maximum Ratio of — per thousand of population ib
- Maximum Ratio of — per thousand of population . ib
- Number of — in different provinces . . . ib
- Population of the different provinces in British India in which — were registered . . . . . ib
- Ratio of male — per thousand of population in British India 3
- Ratio of female — per thousand of population in British India 3
- Total Ratio of — per thousand of population . . 4—5

Buddhists—
- Number of deaths of — . . . . . .20—21
- Ratio of deaths of—per thousand of population 3, 22—23

Children—Number of successfully vaccinated— . 101, 104, 107, 109

Cholera—
- Mortality from— . . . . . .24—25
- Ratio of deaths per thousand of population from — 3, 26—27

Christians—
- Number of deaths of — . . . . . .20—21
- Ratio of deaths per thousand of population of — 3, 22—23
- Religion of — admitted into the Lunatic Asylums 84, 89

Cities—
- Population of certain large — in different provinces of British India . . . . . 10—11
- Ratio of deaths per mille in— . . . . . ib

Classification of hospitals and dispensaries—
- Private non-aided Hospitals and Dispensaries . 76—83
- State Public, Local Funds, and Private-aided hospitals and dispensaries . . . . . .35—63
- State Public, Local Funds, and Private-aided hospitals and dispensaries for females . . . .42—45
- State Special and Railway hospitals and dispensaries . . . . . .64—75

Cost of vaccination by Special Department . 100, 105—106

Criminal Lunatics . . . . . .90—91

Death rate—
- Male — in each 1,000 of population . . . 6—7
- Female — in each 1,000 of population . . . . ib

Deaths—
- Excess of — over births. . . . . 4—5
- Influenza 34
- Number of — according to age . . . .12—15
- Number of — according to causes . . . .24—25
- Number of — according to class . . . .20—21
- Number of — according to months . . .28—31
- Number of female — . . . . . 6—7
- Number of — in different provinces 6—9, 12—15, 20—21, 24—25, 28—31
- Number of — in rural circles . . . . . 8—9
- Number of — in towns . . . . . ib
- Number of male — . . . . . 6—7

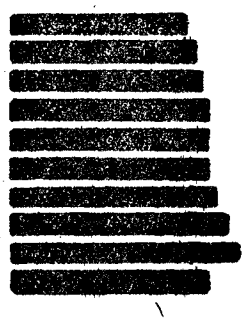
1,618,799	224	Total British India

(a) Birth rate per 1,000 of population

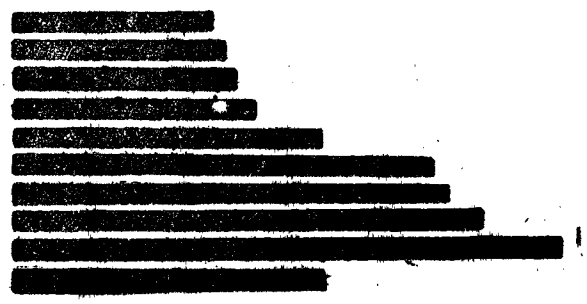
British India



United Kingdom

(b) Death rate per 1,000 of population

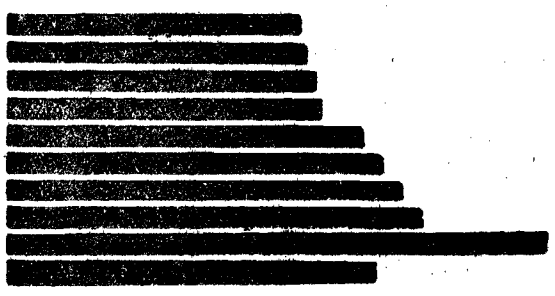
British India



United Kingdom

(c) Infantile mortality per 1,000 births

British India



*Provisional figures.

PREFATORY NOTE.

Public Health Statistics.

This volume of the Statistics of British India deals with statistics relating to Births and Deaths, Hospitals, Lunatic Asylums, Vaccination, and Deaths from wild animals and snakes.

For a descriptive account of these statistics, a reference is invited to the Report of the Sanitary Commissioner with the Government of India for 1919, and to the Resolution of the Government of India in the Home Department on the destruction of wild animals and snakes, No. 2564, dated the 1st October 1920.

Four charts illustrating (i) the Indian birth and death rates for a series of years, (ii) mortality from "fevers" in each province, (iii) mortality from principal diseases in British India, and (iv) birth rate, death rate, and infantile mortality in the major provinces, have been added, with a full index for ready reference.

D. N. GHOSH,
Offg. *Director of Statistics.*

DEPARTMENT OF STATISTICS, INDIA.

Calcutta, June 11, 1921.

No. 15—ESTIMATED NUMBER OF DEATHS from INFLUENZA in 1918 and DEATH RATE per mille of POPULATION in each PROVINCE of **BRITISH INDIA**

Province	Population (Census 1911)	Total number of estimated deaths from influenza	Influenza death rate per thousand of population
Bengal	45,329,247	386,572	8·5
Madras	40,005,735	682,169	16·7
Bombay	19,587,383	1,059,497	54·9
United Provinces	46,820,556	2,034,257	43·4
Bihar and Orissa	34,489,846	709,976	20·5
Punjab	19,337,146	898,947	45·4
Delhi	416,656	23,612	56·6
Burma	9,824,390	137,491	13·9
Central Provinces and Berar	13,916,308	924,949	66·4
Assam	6,051,507	111,340	18·6
North-West Frontier Province	2,041,077	89,035	43·6
Ajmer-Merwara	501,395	29,835	59·5
Coorg	174,976	2,014	11·5
TOTAL FOR BRITISH INDIA	238,496,222	7,089,694	29·7

NOTE—(1) This table gives an estimate by the Sanitary Commissioner with the Government of India of the mortality directly and indirectly due to Influenza in 1918. This estimate was made on the assumption that the excess in the total mortality in 1918 over the mean of the preceding five years, amounting to about seven millions, was the result of influenza and the estimate therefore made no claim for accuracy No estimate for 1919 has yet been made. These estimated figures differ slightly from those given in the Provincial Sanitary reports.

(2) The death rates roughly divide India into two areas: South-east and North-east with a death rate under 20, and the other West, Central and North-West with a death rate of 40 or over. In the first group are included Madras, Bengal, Bihar and Orissa, Assam, and Burma; and in the second group Bombay, the Central Provinces, the United Provinces, Delhi, the Punjab, the North-West Frontier Province, and Ajmer-Merwara.

HOSPITALS.*

No. 16.—NUMBER of STATE-PUBLIC, LOCAL FUND, and PRIVATE-AIDED HOSPITALS and DISPENSARIES in BRITISH INDIA, NUMBER of INDOOR and OUTDOOR PATIENTS treated in them also their INCOME and EXPENDITURE (in rupees)

NOTE (1)—The difference between the number of operations and the number of persons vaccinated is due to secondary operations performed on account of failure on the first occasion; secondary operations, it may be explained, add to the total number of vaccinations, but not to the number of persons vaccinated

(2)—No vaccination is performed by the Dispensary Establishment in Delhi, and Ajmer-Merwara

(a) In Bengal the statistics show particulars of vaccination performed by vaccinators attached to Municipalities, Jails, Cantonments, and Railways, etc. The number of such vaccinators during 1915-16, 1916-17, 1917-18, 1918-19 and 1919-20, were 163, 159, 161, 162 and 186, respectively. The average number of persons vaccinated by each vaccinator in those years being 698, 634, 676, 999 and 1,740, respectively. In other provinces the statistics relate to vaccinations performed by Civil Surgeons or medical subordinates attached to dispensaries as there are no special vaccinators attached to them

No. 38.—TOTAL VACCINATIONS effected by the SPECIAL VACCINATION and DISPENSARY ESTABLISHMENTS (combined) in BRITISH INDIA

Province		Total number successfully vaccinated			Ratio of successful vaccinations per 1,000 of population (*b*)	Annual average of successful vaccinations performed by the Department during the five years previous to each year entered in this table		Average annual deaths from Small-pox during the five years previous to each year entered in this table	
		By Vaccination Department	By Dispensaries	Total		Number	Ratio per 1,000	Number	Ratio per 1,000

Aetiological factors and associated conditions in Lunatics 84, 96

Age—
- Number of deaths according to— . . . .12—15
- Ratio of deaths per thousand of population according to— . . . . . .16—19
- Area in square mile in which deaths were registered . . . . . 6—7
- Average number vaccinated by each vaccinator . 102
- Average cost of each case successfully vaccinated . 106

Beds available in hospitals and dispensaries 35, 37, 40, 43, 45, 64, 66, 76, 78

Births—
- Excess of deaths over — . . . . . 4—5
- Excess of — over deaths . . . . . ib
- Maximum Ratio of — per thousand of population . ib
- Maximum Ratio of — per thousand of population . ib
- Number of — in different provinces . . . ib
- Population of the different provinces in British India in which — were registered . . . ib
- Ratio of male — per thousand of population in British India 3
- Ratio of female — per thousand of population in British India 3
- Total Ratio of — per thousand of population . . 4—5

Buddhists—
- Number of deaths of — . . . . .20—21
- Ratio of deaths of—per thousand of population 3, 22—23

Children—Number of successfully vaccinated— . 101, 104, 107, 109

Cholera—
- Mortality from— . . . . . .24—25
- Ratio of deaths per thousand of population from — 3, 26—27

Christians—
- Number of deaths of — . . . . . .20—21
- Ratio of deaths per thousand of population of — 3, 22—23
- Religion of — admitted into the Lunatic Asylums 84, 89

Cities—
- Population of certain large — in different provinces of British India . . . . . 10—11
- Ratio of deaths per mille in— . . . . . ib

Classification of hospitals and dispensaries—
- Private non-aided Hospitals and Dispensaries . 76—83
- State Public, Local Funds, and Private-aided hospitals and dispensaries . . . . . .35—63
- State Public, Local Funds, and Private-aided hospitals and dispensaries for females . . . .42—45
- State Special and Railway hospitals and dispensaries . . . . . .64—75

Cost of vaccination by Special Department . 100, 105—106

Criminal Lunatics . . . . . .90—91

Death rate—
- Male — in each 1,000 of population . . . 3, 6—7
- Female — in each 1,000 of population . . . ib

Deaths—
- Excess of — over births. . . . . 4—5
- Number of — according to age . . . .12—15
- Number of — according to causes . . . .24—25
- Number of — according to class . . . .20—21
- Number of — according to months . . .28—31
- Number of — in different provinces 6—9, 12—15, 20—21, 24—25, 28—31
- Number of — in rural circles . . . . . 8—9
- Number of — in towns . . . . . ib
- Number of — males . . . . . 3, 6—7
- Number of — females . . . . . 3, 6—7
- Number of — from Influenza (estimated) . . 34

PAGE

Deaths—*contd.*
- Ratio of — per thousand of population in certain large cities and stations . . . . .10—11
- Ratio of — per thousand of population according to age . . . . . .16—19
- Ratio of — per thousand of population according to class . . . . . 3, 22—23
- Ratio of—per thousand of population according to causes . . . . . 3, 26—27
- Ratio of — per thousand of population in each month . . . . . 3, 32—33
- Ratio of — per thousand of population in towns 3, 8—9
- Ratio of — per thousand of population in rural circles . . . . . .3, 8—9

Destruction of wild animals and snakes . . . 112

Diseases for which the patients were treated in—
- State Public, Local Funds, and Private-aided hospitals and dispensaries for males and females . . 46—57
- State Special, Railway, and Private non-aided hospitals and dispensaries . . . . . 64—83

Dispensary Vaccination Establishment—
- Work done by . . . . . .100, 107—109

Dysentery and Diarrhœa—
- Deaths from — . . . . . .24—25
- Ratio of deaths per thousand of population . . 3, 26—27

Establishment—
- Special vaccination 103, 105

Expenditure—
- on Lunatic Asylums . . . . . 98—99
- of State Public, Local Funds, and Private-aided hospitals and dispensaries . . . . . 35, 60—63
- of special Vaccination establishment . . 100, 105, 106
- on rewards paid for the destruction of wild animals and snakes 113

Females—
- Hospitals and dispensaries for— . . . .42—45
- Number of deaths of— 3, 6, 7
- Proportion of deaths of males to— . . . 3

Fevers—
- Number of deaths from — . . . . . .24—25
- Ratio of deaths from — per thousand of population 3, 26—27

Government contribution to State Public, Local Fund and Private-aided hospitals and dispensaries . .58—59

Hindus—
- Number of deaths of — . . . . . .20—21
- Ratio of deaths of — per thousand of population 3, 22—23
- Religion of — admitted into the Lunatic Asylums 84, 89

Hospitals and dispensaries—
- Average daily attendance of outdoor patients in State Public, Local Funds and Private aided — 38, 41
- Beds available in — . 35, 37, 40, 43, 45, 64, 66, 76, 78
- Daily average number of indoor patients in State Public, Local Fund and Private aided — . . 37, 40
- Diseases treated in — . . . . . 46—57, 64—83
- Expenditure of — . . . . . 35, 60—63
- Female — . . . . . .42—45
- Income of State Public, Local Fund and Private aided — . . . . . 35, 58—59
- Indoor and outdoor patients treated in— 35—57, 64—83
- Operations performed in . . . 49, 53, 55, 57, 69, 71, 73, 75, 81, 83
- Private non-aided . . . . . .76—83
- State Public, Local Fund and Private aided . .35—57
- State Special and Railway . . . . . .64—75
